

Eight models. One ORB family.

Portfolio selection research | 2017-01-01 to 2026-09-09 | Eight native MT5 exports | USD 100,000 initial capital

Shortlist D (0.65 ATR, 1% risk) as the conservative candidate and C (0.25 ATR, 0.60% risk) as the growth candidate. H (1% price stop) is a close alternative to D. These are research selections, not independently diversified systems or live-readiness certifications.

Candidate	CAGR	Equity DD	Daily Sharpe	Role
D - ATR 0.65 / 1% risk	13.40%	13.17%	1.059	Conservative primary
C - ATR 0.25 / 0.60% risk	16.86%	21.05%	1.036	Growth primary
H - Price stop 1% / 1% risk	13.37%	13.80%	1.151	Conservative challenger
B - ATR 0.25 / 0.75% risk	21.11%	25.88%	1.038	Higher-risk alternative to C

The early-entry and range filters do not solve the main drawdown problem in this batch. Risk reduction and a wider stop make the largest difference. All eight lose money in both 2019 and 2023; none provides a demonstrated hedge for the ORB family.

Critical setting corrections: E and G enter from 06:05 inclusive to 08:55 exclusive; they are not 07:00-to-close models. H uses a stop equal to 1% of entry price; its retained 0.25 ATR input is inactive. All trades may remain open until 18:55 unless stopped.

The report contains an audit, comparative charts, selection rationale, eight individual studies, joint portfolio simulations, full monthly returns and embedded research data. Balance curves are reconstructed; intratrade equity curves are not available from these exports.

Model map: trust inputs, not filenames

All entry windows are broker-clock times. Range construction is 03:05-06:05 in every run.

ID	Stop	Balance risk	Eligible entry	Range cap	Source filename
A	0.25 D1 ATR	1%	06:05-18:55	OFF	UF_25_1_RISK(1).xlsx
B	0.25 D1 ATR	0.75%	06:05-18:55	OFF	UF_25_075_RISK.xlsx
C	0.25 D1 ATR	0.6%	06:05-18:55	OFF	UF_25_06_RISK.xlsx
D	0.65 D1 ATR	1%	06:05-18:55	OFF	UF_65_1_RISK.xlsx
E	0.25 D1 ATR	1%	06:05-08:55	OFF	UF_25_6-9TIME.xlsx
F	0.25 D1 ATR	1%	06:05-18:55	0.00-0.60 ATR	UF_25_WITHONLY_RANGE.xlsx
G	0.25 D1 ATR	1%	06:05-08:55	0.00-0.60 ATR	UF_25_6-9TIME_WITH_RANGE.xlsx
H	1% entry price	1%	06:05-18:55	OFF	UF_25_PRICE_SL1PERCENT.xlsx

Common settings: reference ATR D1(14); breakout buffer 0.05 x pre-range M5 ATR(14); market touch entry; one successful entry/day; no TP; scheduled close 18:55; fixed lots OFF; absolute spread cap zero; Require_Every_M1_Bar=false. The range cap does not disable or change ATR stop sizing.

A-G report expert OBR_V4. H reports ORB_V5_ALLSL, the build exposing the price-stop input. Its recorded stop distances are approximately 1.0000%-1.0008% of entry price, consistent with 1% plus tick rounding. Equal entry timestamps across A/D/H support comparing their stop behaviour, without proving byte-identical executables.

Audit and comparability

Reconstructed orders and deals, with independent cash and drawdown reconciliation

Check	Finding
Dates / capital / leverage	All configured 2017-01-01 to 2026-09-09; USD 100,000; 1:100. September 2026 is partial.
Feed / history	All MetaQuotes Ltd.; 99% reported history quality; 227,831 bars and 346,317,299 ticks.
Trade ledger	Unique deal IDs; entries and exits pair; trade count, net profit, gross profit/loss and balances reconcile.
Daily limits / holding	At most one completed trade per broker date in each run; no overnight trades in the reconstructed ledgers.
Risk scaling	R denominator uses each run's actual risk input (1%, 0.75%, or 0.60%); no fixed 1% assumption for B/C.
Drawdown	Reconstructed maximum relative balance DD reconciles to the export. Relative equity DD comes from MT5.
Trading costs	Recorded commission and swap are zero. Spread can already be embedded in fills; extra cost tests are stress scenarios.
Remaining limits	No tester journal, tick stream, compiled binary or intratrade equity series supplied; native modelling mode not established by these exports.

The attached A ledger reproduces the previously supplied new-script unfiltered run. Older ICMarkets V2 reports are deliberately excluded from this ranking. The historical period has already informed multiple decisions: it is development data, not fresh out-of-sample evidence.

Performance dashboard

CAGR uses the configured calendar horizon; ratios use consistent reconstructed weekday returns

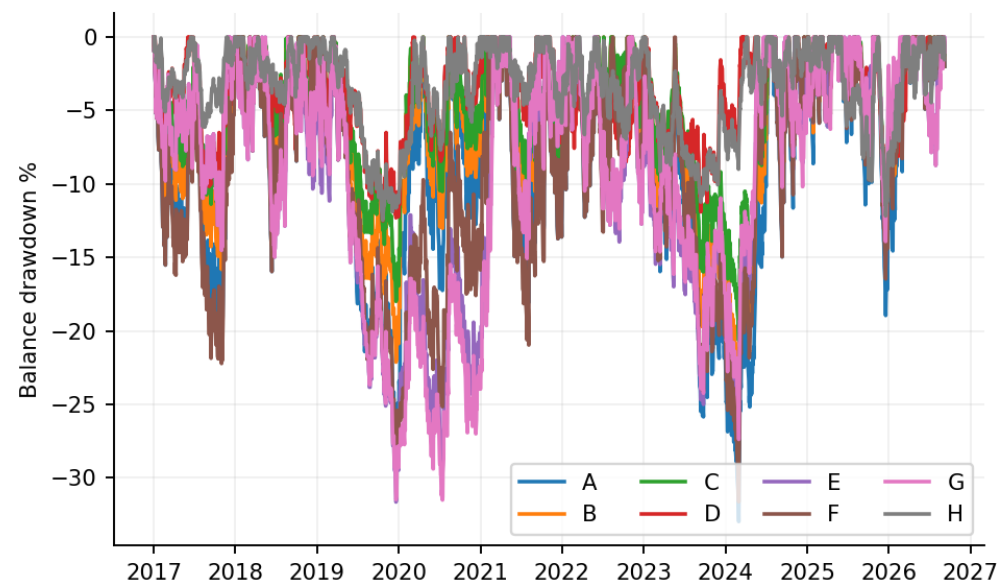

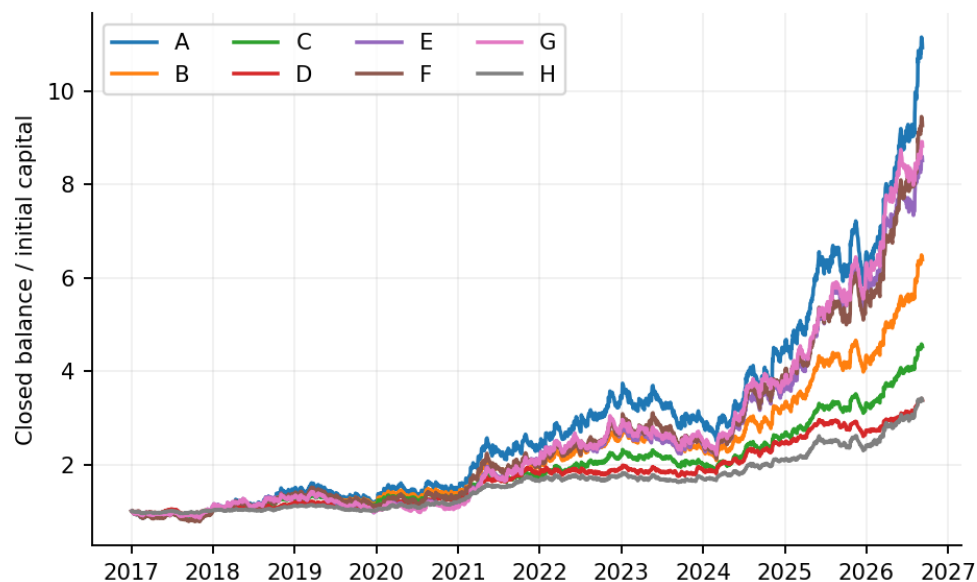

ID	Trades	Net profit \$	CAGR %	PF	Win %	Mean R	Bal DD %	Eq DD %
A	2,479	993,399	28.01	1.246	37.64	0.110	32.99	33.52
B	2,479	539,130	21.11	1.230	37.64	0.110	25.43	25.88
C	2,479	352,483	16.86	1.220	37.64	0.110	20.66	21.05
D	2,479	238,117	13.40	1.206	50.50	0.052	12.50	13.17
E	1,909	751,474	24.75	1.278	37.35	0.126	31.66	32.76
F	2,378	826,483	25.84	1.251	37.93	0.107	31.64	32.56
G	1,853	782,443	25.21	1.299	37.78	0.132	31.52	32.61
H	2,479	237,127	13.37	1.240	50.79	0.051	12.46	13.80

ID	Sharpe	Sortino	Vol %	CAGR/Eq DD	VaR95 %	ES95 %	Losing streak
A	1.038	2.282	26.25	0.836	1.01	1.02	17
B	1.038	2.282	19.67	0.816	0.75	0.76	17
C	1.036	2.277	15.72	0.801	0.60	0.61	17
D	1.059	1.762	12.16	1.018	1.00	1.00	11
E	1.027	2.282	23.42	0.755	1.01	1.02	15
F	0.999	2.178	25.40	0.794	1.01	1.02	17
G	1.059	2.350	22.95	0.773	1.01	1.02	15
H	1.151	1.929	11.06	0.969	1.00	1.00	11

D has the lowest reported equity drawdown; H has the highest daily Sharpe. A has the largest growth but roughly one-third peak-to-trough equity loss. B/C reduce exposure without creating a new source of returns. G has the highest cash PF, yet that does not make it the best drawdown-conscious choice.

Balance growth and drawdown

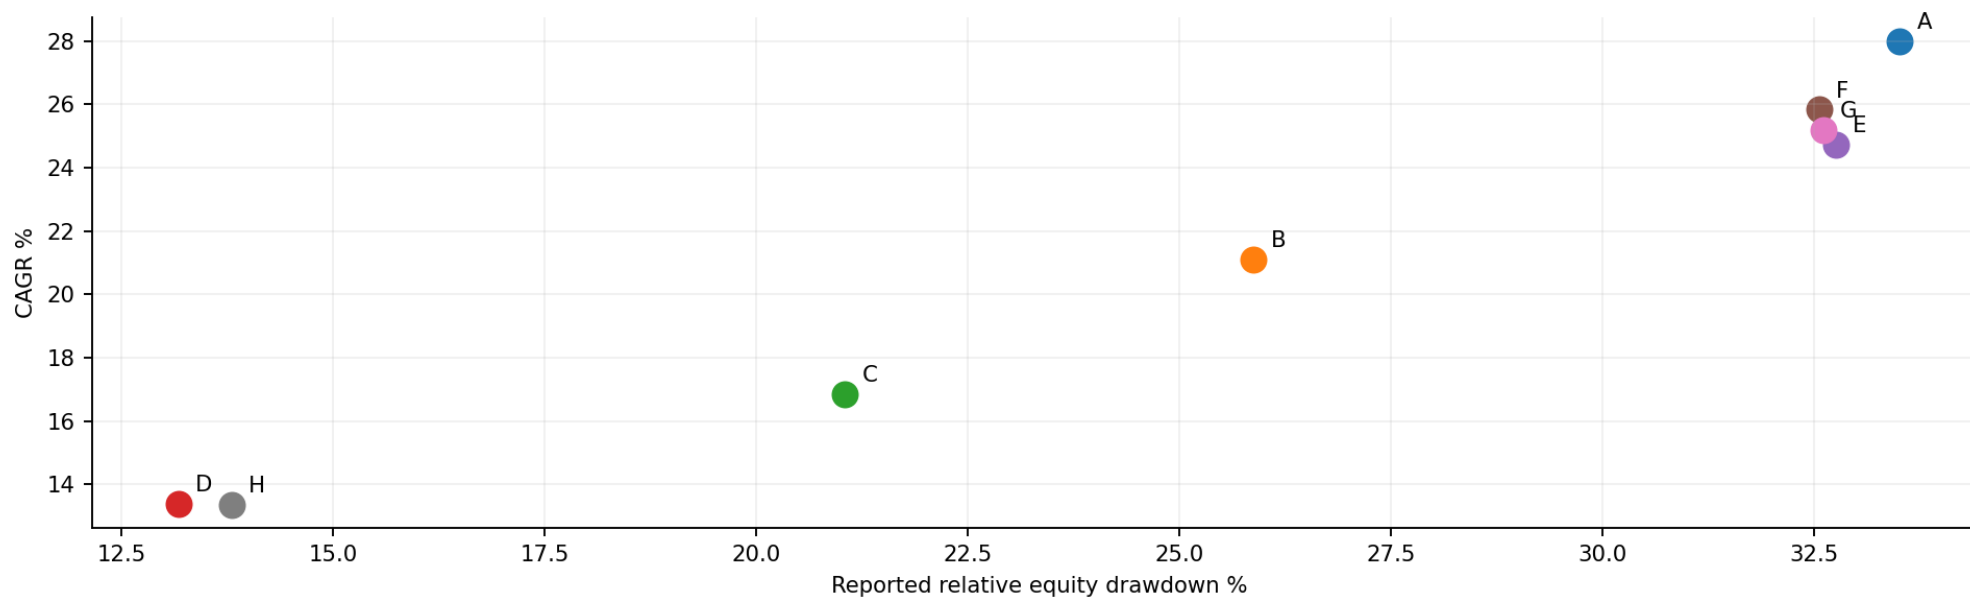

Actual same-capital runs; these are closed-balance paths, not mark-to-market equity

The higher-risk ATR 0.25 variants compound faster but suffer deeper declines. E/F/G remain close to the same drawdown family as A. A higher ending balance or profit factor should not outweigh a loss path that is too large for the intended allocation.

Return versus reported equity drawdown

Upper-left is desirable, but neither axis measures future robustness

D and H cluster near 13.4% CAGR and 13%-14% equity drawdown. C offers 16.86% CAGR at 21.05% equity drawdown. B offers 21.11% at 25.88%. Moving from C to B buys more exposure, not better signals. E/F/G deliver only modest drawdown reductions versus A.

Every year: common strengths and failures

2026 includes only the supplied period through 8 September; annual rows are not annualized

Year	A	B	C	D	E	F	G	H
2017	2.63	2.47	2.29	3.92	11.06	0.94	11.06	2.02
2018	43.05	31.75	25.09	13.85	18.54	35.77	17.67	8.95
2019	-20.41	-15.31	-12.24	-10.03	-24.20	-20.11	-23.26	-9.02
2020	25.01	19.04	15.19	19.89	10.98	16.27	7.59	18.27
2021	58.92	42.74	33.42	41.19	85.67	54.81	89.44	37.59
2022	48.68	35.63	28.05	7.24	33.04	43.03	37.15	8.16
2023	-15.27	-11.14	-8.75	-2.02	-11.27	-12.10	-10.36	-4.17
2024	52.25	37.91	29.71	29.10	48.81	55.95	48.84	22.23
2025	47.19	34.38	26.90	11.81	67.80	48.24	68.98	15.56
2026	66.85	47.29	36.32	23.73	40.47	61.74	39.61	39.93

Every model loses in 2019 and 2023. D/H contain these losses better, but do not reverse their sign. E/G concentrate strong gains in 2021 and 2025 while worsening 2019 versus A. Selection must consider whole-cycle recovery and the dependence on favourable years.

Period	A	B	C	D	E	F	G	H
2017-2019	16.84	14.34	12.30	6.44	-0.20	9.49	0.29	1.13
2020-2022	195.38	130.45	96.79	81.53	174.14	157.47	179.54	76.00
2023	-15.27	-11.14	-8.75	-2.02	-11.27	-12.10	-10.36	-4.17
2024-2026	273.92	172.98	124.38	78.60	250.76	273.90	251.15	97.64

Lower table: compounded segment return %, not the sum of annual percentages. Segment drawdowns and complete period statistics are embedded in the supporting data.

Do the filters earn their complexity?

Matched-date trades retain identical entry timestamps and direction; exclusions are measured directly

Change	Removed trades	Removed net R	Net profit retained	Equity DD reduction
A to E	570	31.85	75.65%	2.27%
A to F	101	18.51	83.20%	2.86%
A to G	626	29.20	78.76%	2.71%
E to G	56	-2.60	104.12%	0.46%

A to E: ending entry eligibility at 08:55 removes 570 trades with +31.85R in aggregate. It keeps 75.65% of net profit, but cuts relative equity DD by only 2.27% (33.52% to 32.76%). That is a poor trade-off for this objective.

A to F: the range cap removes 101 trades with +18.51R. Net profit retention is 83.20%, with only 2.86% relative equity-DD reduction. Removing a low-win-rate bucket can still remove valuable large winners.

E to G: adding the range cap within the early window removes 56 trades with -2.60R, so it helps this subset modestly. Its equity DD still remains 32.61%. A conditional improvement is not evidence that the range cap works universally.

Profit retention uses compounded net dollars from the same initial capital. Removed R uses the parent run's risk units; it is not an exact additive attribution of compounded dollar profit.

Risk reduction versus changing the stop

B/C are actual MT5 reruns; the 0.35% row below is a transparent return-path replay

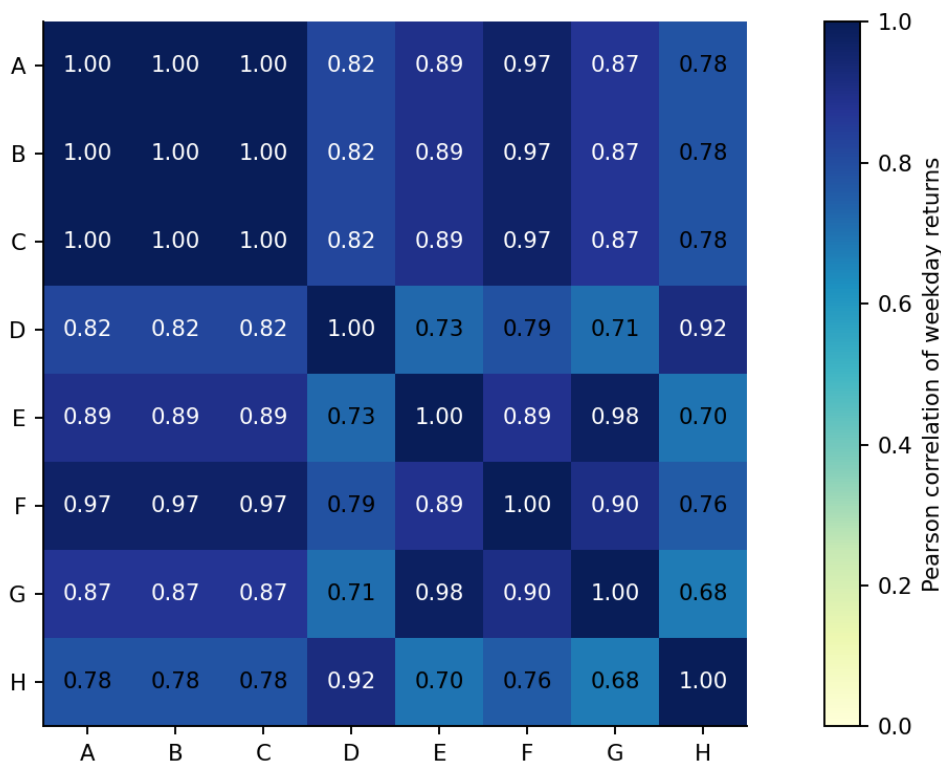

Configuration	CAGR %	Balance DD %	CAGR / balance DD	Interpretation
A: ATR 0.25, 1% risk	28.01	32.99	0.849	Highest exposure
B: ATR 0.25, 0.75%	21.11	25.43	0.830	Same signals
C: ATR 0.25, 0.60%	16.86	20.66	0.816	Preferred growth sizing
A replay: 0.35% risk	9.89	12.36	0.800	Approximate exposure match
D: ATR 0.65, 1%	13.40	12.50	1.072	Different exit behaviour
H: 1% price SL, 1% risk	13.37	12.46	1.072	Different stop scaling

At approximately similar historical balance drawdown, D produces 13.40% CAGR versus 9.89% for A replayed at 0.35% risk. This suggests the wider stop offers more than simply reducing the tight-stop position size on this sample. It does not establish future superiority.

A/B/C have all 2,479 entry timestamps and directions in common, with daily-return correlation essentially 1. Small differences in mean R reflect lot rounding and execution arithmetic. Holding two risk settings of the same signal does not diversify the portfolio.

Correlation and overlapping losses

All weekday returns aligned on the same calendar; zero-trade days included

C-D correlation is 0.818; C-H is 0.781; D-H is 0.915. Even the least correlated pair in this batch (G-H, 0.678) is substantially related. These eight runs are one Gold ORB family, not eight independent systems. Keep the remaining portfolio slots for separately validated sources of returns.

Shortlist and allocation decision

Choose one primary ORB model; use a second only as a deliberate blend of stop behaviours

Choice	Reason	Trade-off
D - conservative primary	13.40% CAGR; 13.17% reported equity DD; volatility-adaptive stop.	Lower growth than tight stops; still loses in weak ORB years.
C - growth primary	16.86% CAGR; 21.05% equity DD; same simple unfiltered entries.	Its drawdown is still substantial; risk reduction does not repair negative regimes.
H - challenger to D	13.37% CAGR; highest daily Sharpe (1.151); C-H has slightly lower correlation.	13.80% equity DD; price-based width changes relative to volatility.
B - aggressive alternative	21.11% CAGR at 0.75% risk, with no additional rule complexity.	25.88% equity DD; choose instead of C, not alongside it.
A / E / F / G	Keep as research controls; G improves on E modestly.	No compelling drawdown benefit for the intended shortlist.

If only one model enters the portfolio: D is my conservative choice. If growth justifies greater drawdown: C. If you want two: C plus either D or H, with a shared ORB risk budget. The evidence does not strongly separate D and H; D is preferred for the lower observed equity DD and volatility-adaptive design, not because it dominates every metric.

The previously discussed 07:00-to-close model is not one of these eight. E/G start at 06:05 and end at 08:55; conclusions about them must not be transferred to the 07:00-to-close rule.

Portfolio simulations: explicit allocation assumptions

Daily rebalanced capital weights, starting USD 100,000; original simultaneous return observations preserved

Mix	CAGR %	Balance DD %	Sharpe	End balance \$	20-day bootstrap DD95 %
C50 / D50	15.24	15.14	1.096	395,138	28.01
B50 / D50	17.40	17.27	1.094	473,099	31.36
C50 / H50	15.25	14.82	1.146	395,307	26.61
D50 / H50	13.42	12.47	1.127	338,626	25.48
C70 / D30	15.92	16.85	1.079	418,170	29.65

C50/D50 means 50% of capital assigned to C at its tested 0.60% risk and 50% to D at its tested 1% risk. When both enter, nominal total-account stop risk is approximately $0.30\% + 0.50\% = 0.80\%$, before gaps and costs. It does not mean running both at their full risk against the entire account.

C50/H50 has slightly better historical balance-DD efficiency than C50/D50, but this small difference is in-sample. D50/H50 adds little diversification because their return correlation is 0.915. No weight optimization was performed; allocations are illustrative fixed scenarios.

Portfolio balance = prior balance $\times$ (1 + weighted sum of that day's recorded returns). Lot rounding, margin, fills, commissions and intraday equity are not re-simulated. These are closed-balance simulations; combined equity DD cannot be recovered from closed trades alone.

Can two variants actually run together?

Statistical blending and executable portfolio behaviour are separate questions

Pair	Common dates	Identical entry times	Both losing days	Second loses when first loses
C / D	2479	2479	1227	79.37%
C / H	2479	2479	1218	78.78%
D / H	2479	2479	1210	98.61%

The reviewed fast EA blocks entries when the symbol already has a position or pending order, including another EA's position. All supplied inputs also use magic number 325070. Attaching two copies unchanged therefore will not reproduce the simulated two-position portfolio. Different magic numbers alone do not bypass the symbol-busy rule.

Concurrent same-symbol sleeves need a deliberately tested execution design: for example, separate accounts, or a portfolio-aware implementation with appropriate hedging/netting handling and distinct strategy identity. Netting accounts cannot retain two independent same-symbol positions with separate stop orders in the same way as hedging accounts.

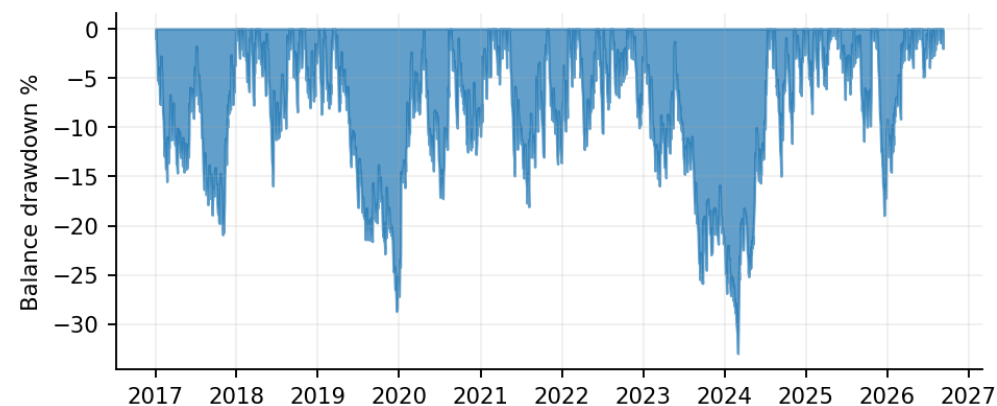

For now, freeze the selected model and its settings, assess additional costs and forward execution, and treat both proposed ORB sleeves as one correlated risk allocation. The simulations are research comparisons, not instructions to attach two copies unchanged.

A | ATR 0.25 / 1% risk

Individual model study 1/4 | UF_25_1_RISK(1).xlsx

High-return reference; not the preferred drawdown-conscious allocation.

Metric	Value	Metric	Value
Net profit USD	993,399.34	Mean R / trade	0.110
Ending balance USD	1,093,399.34	Total R	273.13
CAGR %	28.01	Trades	2,479
Cash profit factor	1.246	Balance DD %	32.99
R profit factor	1.188	Relative equity DD %	33.52
Positive-net win %	37.64	CAGR / equity DD	0.836

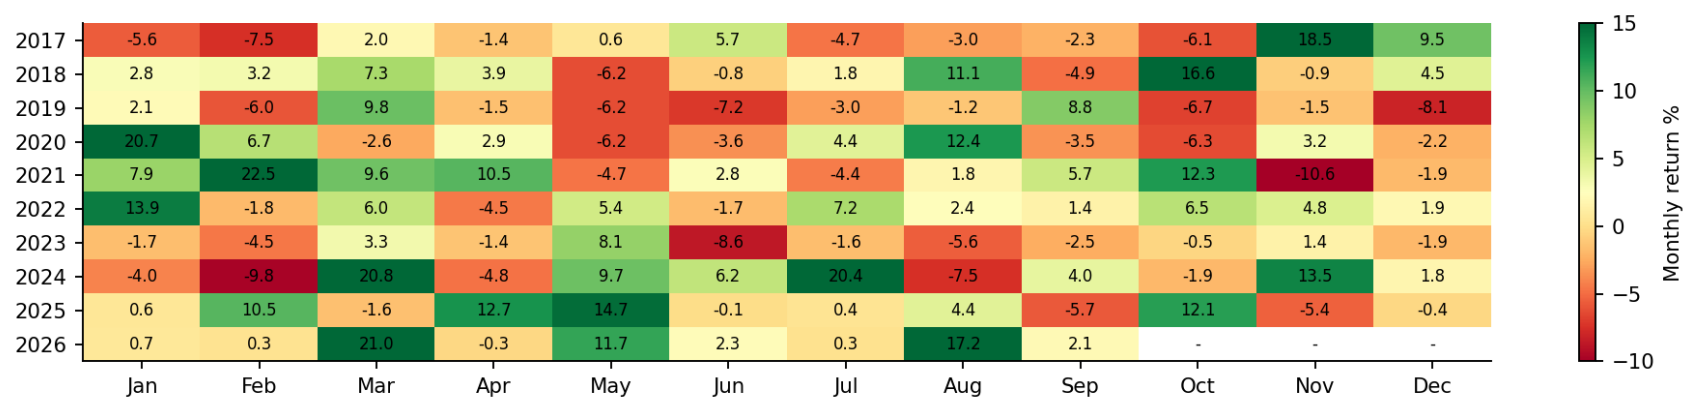

First entry 2017-01-03 08:32:37; last exit 2026-09-08 09:05:39. Average estimated initial stop risk 0.999% of balance, against an input of 1%. Entries average 21.2 per calendar month. This is a 37.64% win-rate model; losing trades are expected to be frequent.

A | Annual and monthly consistency

Individual model study 2/4 | Monthly returns use each month's opening balance

Year	Trades	Return %	Net R	PF	Win %
2017	255	2.63	5.42	1.019	34.12
2018	257	43.05	39.78	1.243	39.30
2019	256	-20.41	-20.23	0.860	34.77
2020	257	25.01	25.97	1.129	36.96
2021	257	58.92	50.87	1.245	35.41
2022	257	48.68	43.63	1.256	36.96
2023	256	-15.27	-13.17	0.903	31.64
2024	258	52.25	45.63	1.301	41.09
2025	254	47.19	41.94	1.260	40.55
2026	172	66.85	53.28	1.697	49.42

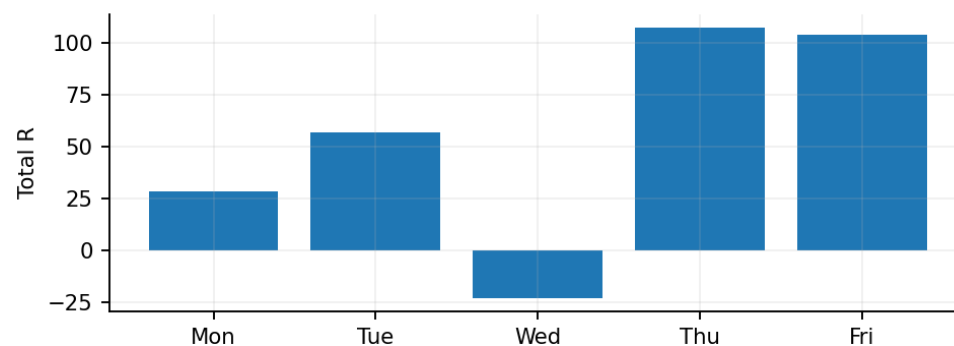

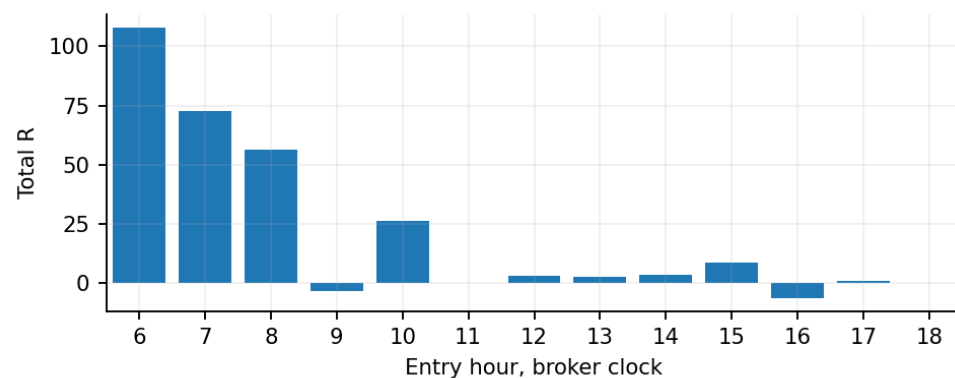

Positive months: 64/117. Positive weeks: 254/506 active weeks. Best month 2021-02: 22.51%; worst 2021-11: -10.61%. Blank heatmap cells are beyond the test end, not zero returns.

A | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	1289	1.302	157.33	0.122	39.26
sell	1190	1.191	115.80	0.097	35.88
SL	1403	0.000	-1,405.55	-1.002	0.00
EOD	1076	36.287	1,678.68	1.560	86.71
OTHER	0	-	0.00	-	-

Avg winner R	Avg loser R	Win streak	Loss streak	Avg holding h	Worst trade %	Best trade %
1.85	-0.94	7	17	7.78	-1.47	9.40

SL classification uses the MT5 closing-deal comment; EOD classification uses an 18:55 exit timestamp. OTHER remains explicit. Total R by hour/weekday reflects both trade frequency and payoff; small buckets are not strong evidence for another filter. No new hour mask was optimized.

A | Drawdown, tail risk and robustness

Individual model study 4/4 | Historical losses are observations, not upper bounds

Peak	Trough	Recovery	Days	Balance DD %
2023-01-06	2024-03-01	2024-07-11	552	32.99
2019-03-18	2019-12-20	2020-08-17	518	28.70
2017-01-01	2017-10-31	2017-12-29	363	20.92

Daily Sharpe	Sortino	Ann. vol %	Daily VaR95 %	Daily ES95 %
1.038	2.282	26.25	1.01	1.02

Bootstrap block	Median DD %	DD95 %	DD99 %	CAGR5 %
5	33.78	49.76	60.96	11.63
20	32.46	47.89	54.09	13.34

Extra USD / round-trip lot	Net profit \$	Cash PF	Mean R
0	993,399	1.246	0.110
7	925,202	1.226	0.097
20	798,551	1.192	0.072
27	730,354	1.174	0.059

Top 1/5/10 cash winners contribute 5.20% / 24.71% / 41.45% of net profit. Top 10 R winners contribute 30.37% of total R; mean R after removing them is 0.077. Removal is a diagnostic, not a realistic replacement backtest.

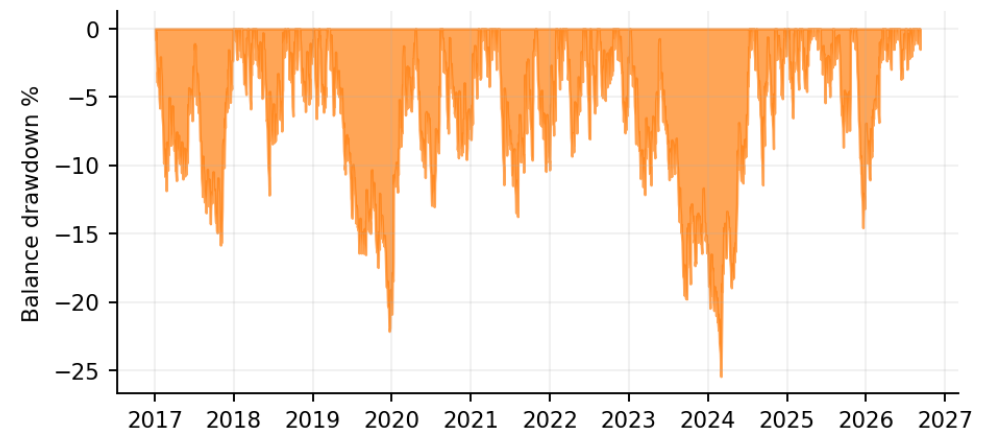

Recovery rows are the three longest episodes, measured peak-to-recovery (or test end). Bootstrap uses 2,000 circular 5/20-weekday blocks, preserving short dependence; it is conditional on this history. Additional cost tests subtract costs at original recorded volumes without rerunning position sizing.

B | ATR 0.25 / 0.75% risk

Individual model study 1/4 | UF_25_075_RISK.xlsx

Aggressive sizing alternative; do not hold alongside C as a separate system.

Metric	Value	Metric	Value
Net profit USD	539,129.91	Mean R / trade	0.110
Ending balance USD	639,129.91	Total R	272.87
CAGR %	21.11	Trades	2,479
Cash profit factor	1.230	Balance DD %	25.43
R profit factor	1.188	Relative equity DD %	25.88
Positive-net win %	37.64	CAGR / equity DD	0.816

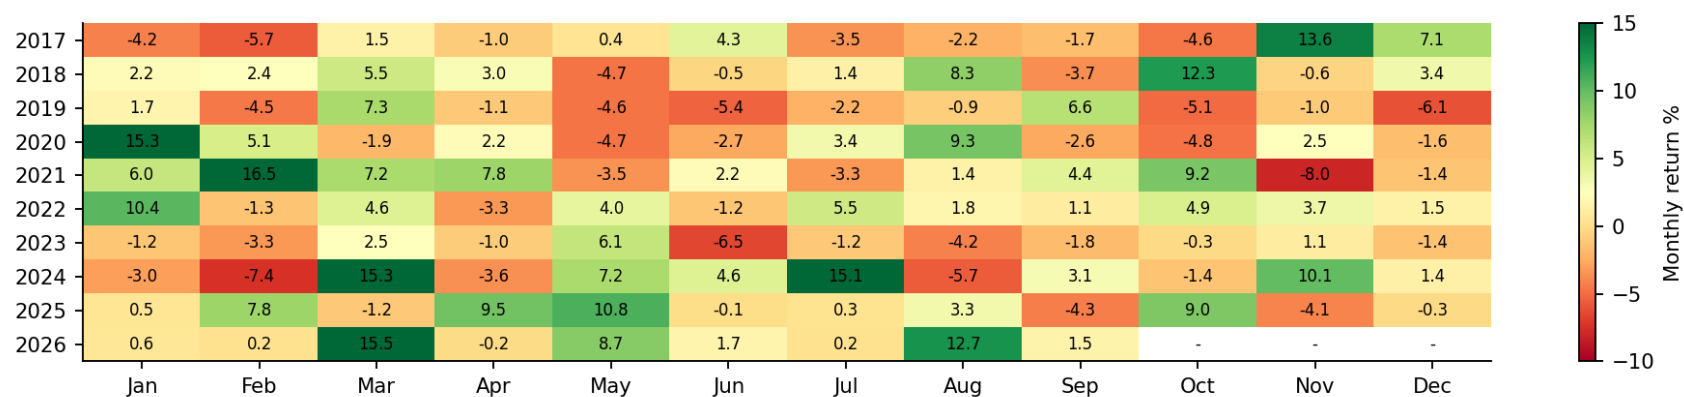

First entry 2017-01-03 08:32:37; last exit 2026-09-08 09:05:39. Average estimated initial stop risk 0.748% of balance, against an input of 0.75%. Entries average 21.2 per calendar month. This is a 37.64% win-rate model; losing trades are expected to be frequent.

B | Annual and monthly consistency

Individual model study 2/4 | Monthly returns use each month's opening balance

Year	Trades	Return %	Net R	PF	Win %
2017	255	2.47	5.38	1.023	34.12
2018	257	31.75	39.77	1.249	39.30
2019	256	-15.31	-20.21	0.862	34.77
2020	257	19.04	25.98	1.138	36.96
2021	257	42.74	50.87	1.263	35.41
2022	257	35.63	43.62	1.263	36.96
2023	256	-11.14	-13.18	0.907	31.64
2024	258	37.91	45.56	1.304	41.09
2025	254	34.38	41.87	1.271	40.55
2026	172	47.29	53.20	1.696	49.42

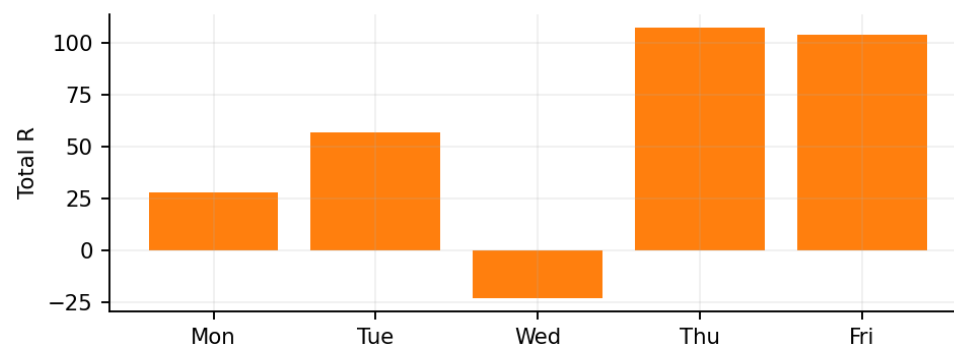

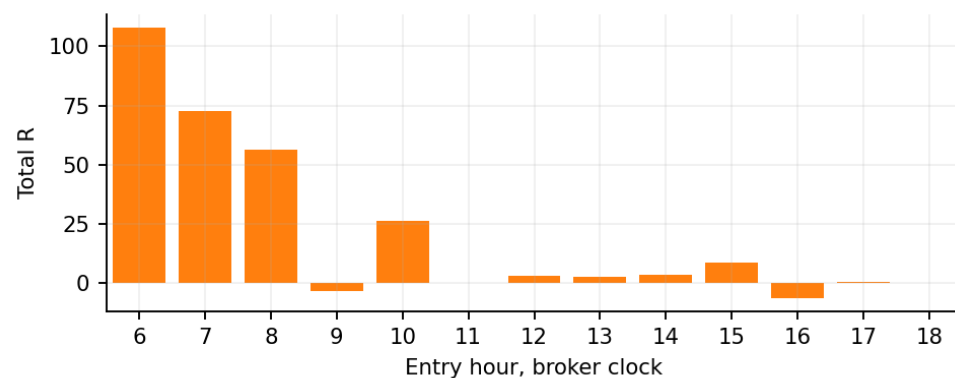

Positive months: 64/117. Positive weeks: 254/506 active weeks. Best month 2021-02: 16.53%; worst 2021-11: -8.02%. Blank heatmap cells are beyond the test end, not zero returns.

B | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	1289	1.277	157.21	0.122	39.26
sell	1190	1.184	115.67	0.097	35.88
SL	1403	0.000	-1,404.33	-1.001	0.00
EOD	1076	37.160	1,677.20	1.559	86.71
OTHER	0	-	0.00	-	-

Avg winner R	Avg loser R	Win streak	Loss streak	Avg holding h	Worst trade %	Best trade %
1.84	-0.94	7	17	7.78	-1.10	7.06

SL classification uses the MT5 closing-deal comment; EOD classification uses an 18:55 exit timestamp. OTHER remains explicit. Total R by hour/weekday reflects both trade frequency and payoff; small buckets are not strong evidence for another filter. No new hour mask was optimized.

B | Drawdown, tail risk and robustness

Individual model study 4/4 | Historical losses are observations, not upper bounds

Peak	Trough	Recovery	Days	Balance DD %
2023-01-06	2024-03-01	2024-07-11	552	25.43
2019-03-18	2019-12-20	2020-04-20	399	22.13
2017-01-01	2017-10-31	2017-12-28	362	15.82
Daily Sharpe	Sortino	Ann. vol %	Daily VaR95 %	Daily ES95 %
1.038	2.282	19.67	0.75	0.76
Bootstrap block	Median DD %	DD95 %	DD99 %	CAGR5 %
5	26.26	39.76	49.80	9.26
20	25.18	38.19	43.79	10.50
Extra USD / round-trip lot	Net profit \$	Cash PF	Mean R	
0	539,130	1.230	0.110	
7	496,689	1.210	0.097	
20	417,869	1.173	0.072	
27	375,428	1.153	0.059	

Top 1/5/10 cash winners contribute 4.85% / 22.18% / 37.86% of net profit. Top 10 R winners contribute 30.39% of total R; mean R after removing them is 0.077. Removal is a diagnostic, not a realistic replacement backtest.

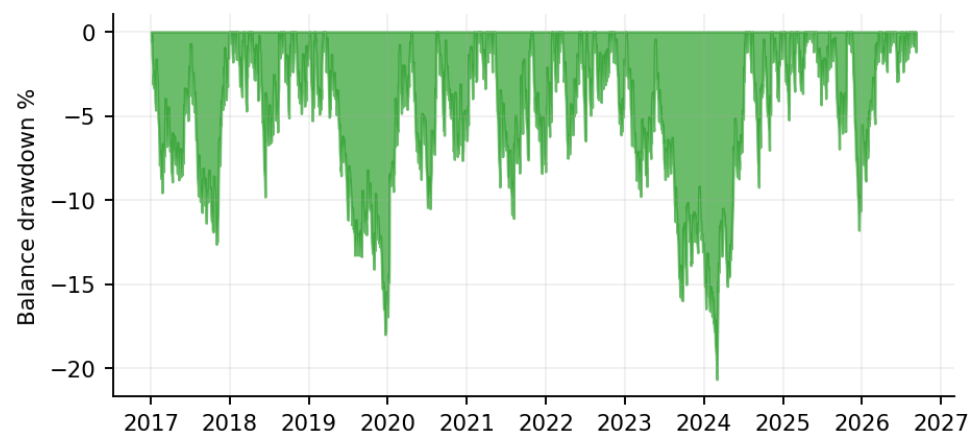

Recovery rows are the three longest episodes, measured peak-to-recovery (or test end). Bootstrap uses 2,000 circular 5/20-weekday blocks, preserving short dependence; it is conditional on this history. Additional cost tests subtract costs at original recorded volumes without rerunning position sizing.

C | ATR 0.25 / 0.60% risk

Individual model study 1/4 | UF_25_06_RISK.xlsx

Preferred growth candidate within the ATR 0.25 family; lower risk, same signals.

Metric	Value	Metric	Value
Net profit USD	352,483.44	Mean R / trade	0.110
Ending balance USD	452,483.44	Total R	272.05
CAGR %	16.86	Trades	2,479
Cash profit factor	1.220	Balance DD %	20.66
R profit factor	1.188	Relative equity DD %	21.05
Positive-net win %	37.64	CAGR / equity DD	0.801

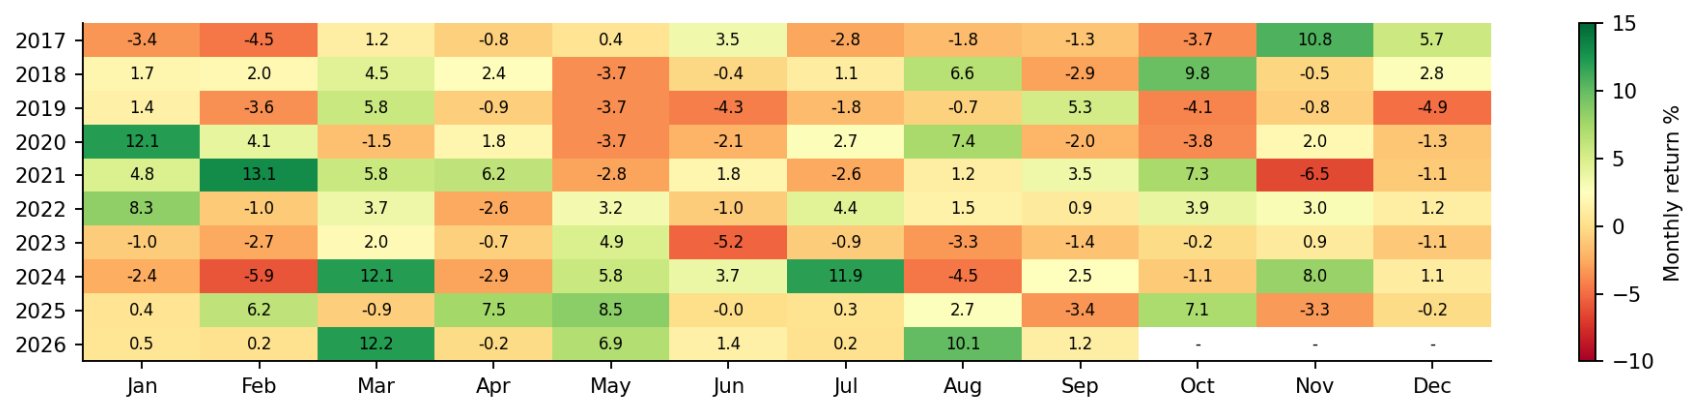

First entry 2017-01-03 08:32:37; last exit 2026-09-08 09:05:39. Average estimated initial stop risk 0.598% of balance, against an input of 0.6%. Entries average 21.2 per calendar month. This is a 37.64% win-rate model; losing trades are expected to be frequent.

C | Annual and monthly consistency

Individual model study 2/4 | Monthly returns use each month's opening balance

Year	Trades	Return %	Net R	PF	Win %
2017	255	2.29	5.48	1.026	34.12
2018	257	25.09	39.71	1.252	39.30
2019	256	-12.24	-20.19	0.864	34.77
2020	257	15.19	25.76	1.143	36.96
2021	257	33.42	50.80	1.274	35.41
2022	257	28.05	43.61	1.268	36.96
2023	256	-8.75	-13.21	0.909	31.64
2024	258	29.71	45.52	1.306	41.09
2025	254	26.90	41.68	1.277	40.55
2026	172	36.32	52.88	1.692	49.42

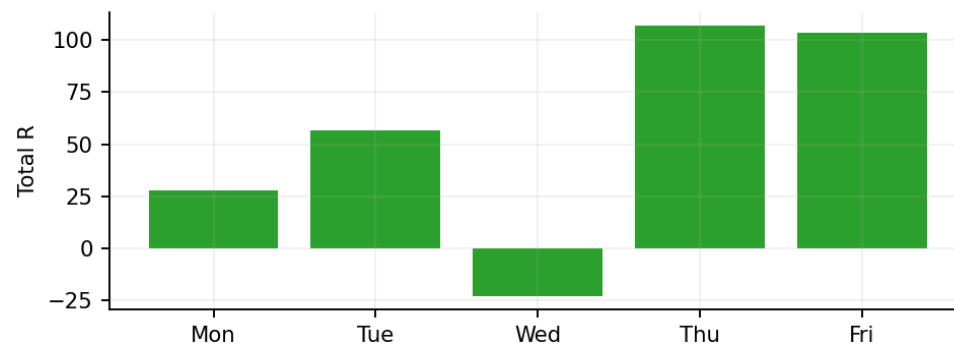

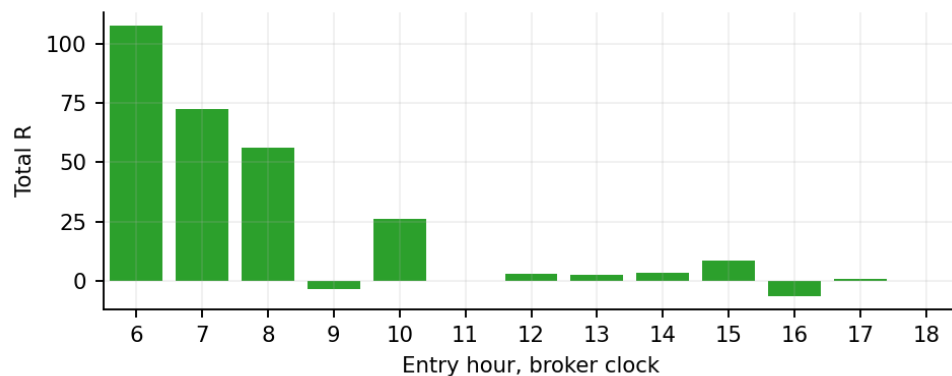

Positive months: 64/117. Positive weeks: 254/506 active weeks. Best month 2021-02: 13.08%; worst 2021-11: -6.46%. Blank heatmap cells are beyond the test end, not zero returns.

C | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	1289	1.263	156.85	0.122	39.26
sell	1190	1.179	115.21	0.097	35.88
SL	1403	0.000	-1,403.18	-1.000	0.00
EOD	1076	37.632	1,675.23	1.557	86.71
OTHER	0	-	0.00	-	-

Avg winner R	Avg loser R	Win streak	Loss streak	Avg holding h	Worst trade %	Best trade %
1.84	-0.94	7	17	7.78	-0.88	5.63

SL classification uses the MT5 closing-deal comment; EOD classification uses an 18:55 exit timestamp. OTHER remains explicit. Total R by hour/weekday reflects both trade frequency and payoff; small buckets are not strong evidence for another filter. No new hour mask was optimized.

C | Drawdown, tail risk and robustness

Individual model study 4/4 | Historical losses are observations, not upper bounds

Peak	Trough	Recovery	Days	Balance DD %
2023-01-06	2024-03-01	2024-07-11	552	20.66
2019-03-18	2019-12-20	2020-04-20	399	18.00
2017-01-01	2017-10-31	2017-12-28	362	12.63

Daily Sharpe	Sortino	Ann. vol %	Daily VaR95 %	Daily ES95 %
1.036	2.277	15.72	0.60	0.61

Bootstrap block	Median DD %	DD95 %	DD99 %	CAGR5 %
5	21.50	33.06	42.15	7.60
20	20.58	31.76	36.72	8.60

Extra USD / round-trip lot	Net profit \$	Cash PF	Mean R
0	352,483	1.220	0.110
7	322,169	1.199	0.097
20	265,870	1.161	0.072
27	235,555	1.141	0.059

Top 1/5/10 cash winners contribute 4.60% / 20.45% / 35.60% of net profit. Top 10 R winners contribute 30.41% of total R; mean R after removing them is 0.077. Removal is a diagnostic, not a realistic replacement backtest.

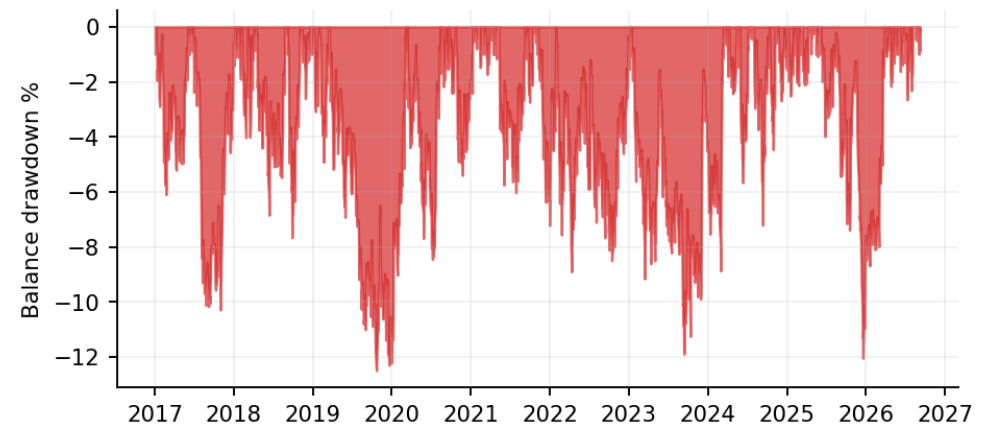

Recovery rows are the three longest episodes, measured peak-to-recovery (or test end). Bootstrap uses 2,000 circular 5/20-weekday blocks, preserving short dependence; it is conditional on this history. Additional cost tests subtract costs at original recorded volumes without rerunning position sizing.

D | ATR 0.65 / 1% risk

Individual model study 1/4 | UF_65_1_RISK.xlsx

Primary conservative candidate: volatility-adaptive stop, lowest reported equity DD.

Metric	Value	Metric	Value
Net profit USD	238,116.79	Mean R / trade	0.052
Ending balance USD	338,116.79	Total R	129.23
CAGR %	13.40	Trades	2,479
Cash profit factor	1.206	Balance DD %	12.50
R profit factor	1.190	Relative equity DD %	13.17
Positive-net win %	50.50	CAGR / equity DD	1.018

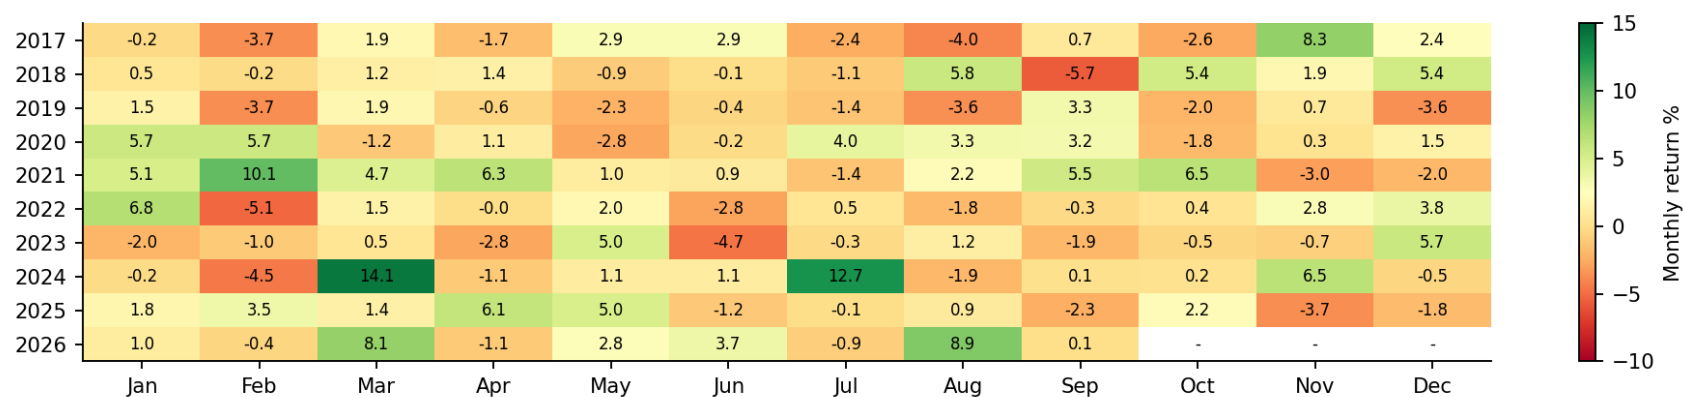

First entry 2017-01-03 08:32:37; last exit 2026-09-08 18:55:00. Average estimated initial stop risk 0.994% of balance, against an input of 1%. Entries average 21.2 per calendar month. This is a 50.50% win-rate model; losing trades are expected to be frequent.

D | Annual and monthly consistency

Individual model study 2/4 | Monthly returns use each month's opening balance

Year	Trades	Return %	Net R	PF	Win %
2017	255	3.92	4.46	1.057	46.67
2018	257	13.85	13.78	1.188	50.97
2019	256	-10.03	-9.94	0.862	47.27
2020	257	19.89	18.98	1.254	51.36
2021	257	41.19	35.33	1.507	49.81
2022	257	7.24	7.88	1.086	49.42
2023	256	-2.02	-1.20	0.973	45.31
2024	258	29.10	26.34	1.388	55.43
2025	254	11.81	11.89	1.149	51.97
2026	172	23.73	21.71	1.620	59.88

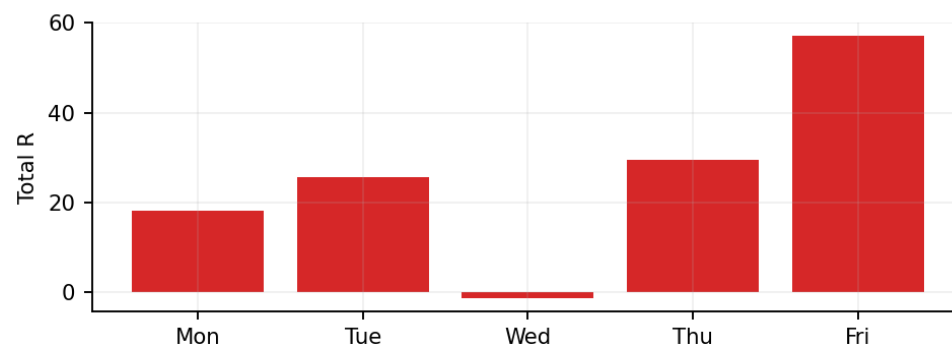

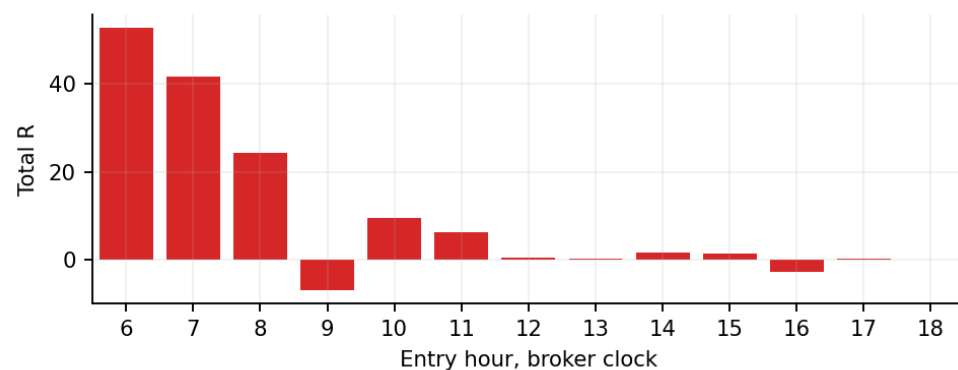

Positive months: 65/117. Positive weeks: 291/506 active weeks. Best month 2024-03: 14.11%; worst 2018-09: -5.69%. Blank heatmap cells are beyond the test end, not zero returns.

D | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	1289	1.342	98.96	0.077	52.60

2021	195	89.44	67.81	1.488	37.95
2022	200	37.15	34.71	1.254	36.00
2023	197	-10.36	-8.20	0.916	30.96
2024	196	48.84	42.48	1.354	42.35
2025	185	68.98	55.05	1.539	45.41
2026	121	39.61	34.87	1.579	48.76

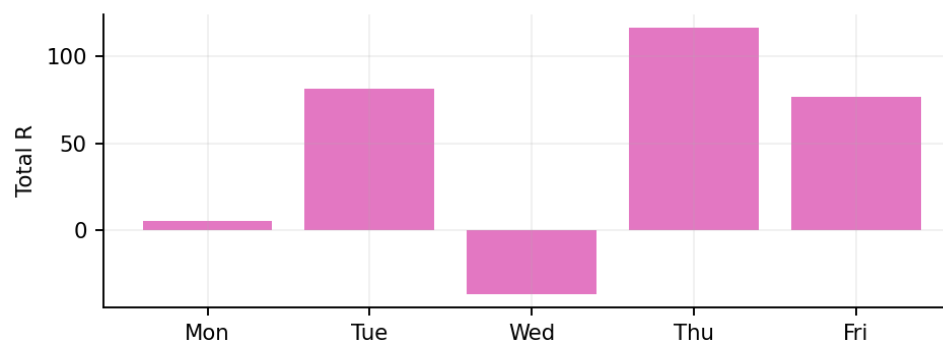

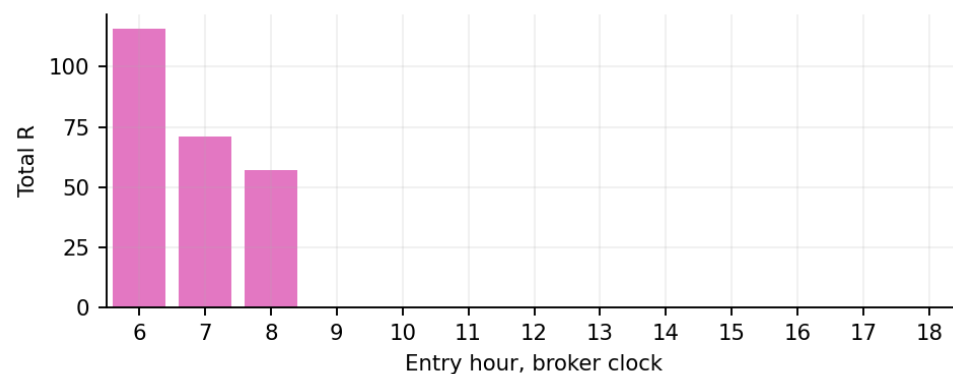

Positive months: 62/117. Positive weeks: 239/504 active weeks. Best month 2021-02: 24.70%; worst 2019-10: -9.26%. Blank heatmap cells are beyond the test end, not zero returns.

G | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	978	1.293	124.34	0.127	38.45
sell	875	1.304	119.39	0.136	37.03
SL	1055	0.000	-1,056.88	-1.002	0.00
EOD	798	44.081	1,300.60	1.630	87.72
OTHER	0	-	0.00	-	-

Avg winner R	Avg loser R	Win streak	Loss streak	Avg holding h	Worst trade %	Best trade %
1.90	-0.94	8	15	8.42	-1.47	9.28

SL classification uses the MT5 closing-deal comment; EOD classification uses an 18:55 exit timestamp. OTHER remains explicit. Total R by hour/weekday reflects both trade frequency and payoff; small buckets are not strong evidence for another filter. No new hour mask was optimized.

G | Drawdown, tail risk and robustness

Individual model study 4/4 | Historical losses are observations, not upper bounds

Peak	Trough	Recovery	Days	Balance DD %
2019-03-18	2020-07-15	2021-02-26	711	31.52
2022-11-11	2024-03-01	2024-05-22	558	27.40
2017-01-01	2017-10-31	2017-11-30	334	14.52

Daily Sharpe	Sortino	Ann. vol %	Daily VaR95 %	Daily ES95 %
1.059	2.350	22.95	1.01	1.02

Bootstrap block	Median DD %	DD95 %	DD99 %	CAGR5 %
5	30.12	45.18	53.28	11.14
20	29.11	43.74	51.38	11.81

Extra USD / round-trip lot	Net profit \$	Cash PF	Mean R
0	782,443	1.299	0.132
7	737,285	1.278	0.118
20	653,421	1.242	0.093
27	608,263	1.223	0.080

Top 1/5/10 cash winners contribute 6.36% / 26.95% / 41.91% of net profit. Top 10 R winners contribute 31.79% of total R; mean R after removing them is 0.090. Removal is a diagnostic, not a realistic replacement backtest.

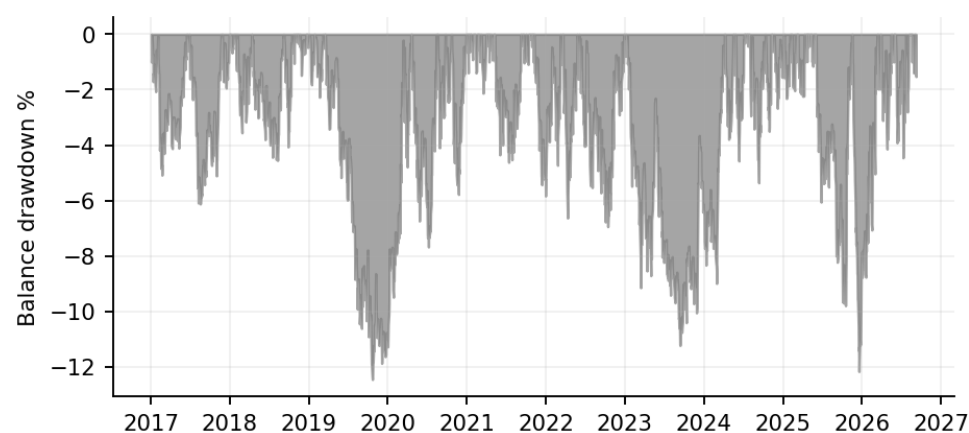

Recovery rows are the three longest episodes, measured peak-to-recovery (or test end). Bootstrap uses 2,000 circular 5/20-weekday blocks, preserving short dependence; it is conditional on this history. Additional cost tests subtract costs at original recorded volumes without rerunning position sizing.

H | Price stop 1% / 1% risk

Individual model study 1/4 | UF_25_PRICE_SL1PERCENT.xlsx

Close conservative challenger; strongest daily Sharpe, but higher equity DD than D.

Metric	Value	Metric	Value
Net profit USD	237,126.80	Mean R / trade	0.051
Ending balance USD	337,126.80	Total R	127.66
CAGR %	13.37	Trades	2,479
Cash profit factor	1.240	Balance DD %	12.46
R profit factor	1.216	Relative equity DD %	13.80
Positive-net win %	50.79	CAGR / equity DD	0.969

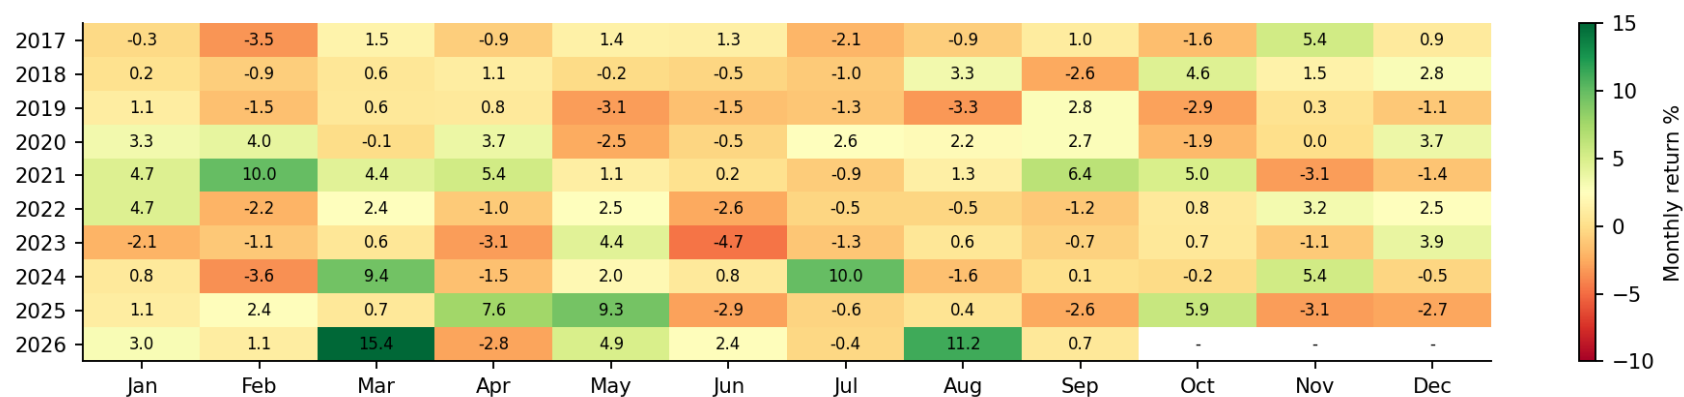

First entry 2017-01-03 08:32:37; last exit 2026-09-08 10:37:37. Average estimated initial stop risk 0.994% of balance, against an input of 1%. Entries average 21.2 per calendar month. This is a 50.79% win-rate model; losing trades are expected to be frequent.

H | Annual and monthly consistency

Individual model study 2/4 | Monthly returns use each month's opening balance

Year	Trades	Return %	Net R	PF	Win %
2017	255	2.02	2.27	1.045	47.84
2018	257	8.95	8.90	1.201	51.36
2019	256	-9.02	-9.11	0.829	48.44
2020	257	18.27	17.67	1.225	52.14
2021	257	37.59	32.51	1.578	50.97
2022	257	8.16	8.54	1.110	49.81
2023	256	-4.17	-3.71	0.933	46.09
2024	258	22.23	20.64	1.348	55.81
2025	254	15.56	15.30	1.187	50.79
2026	172	39.93	34.64	1.582	56.40

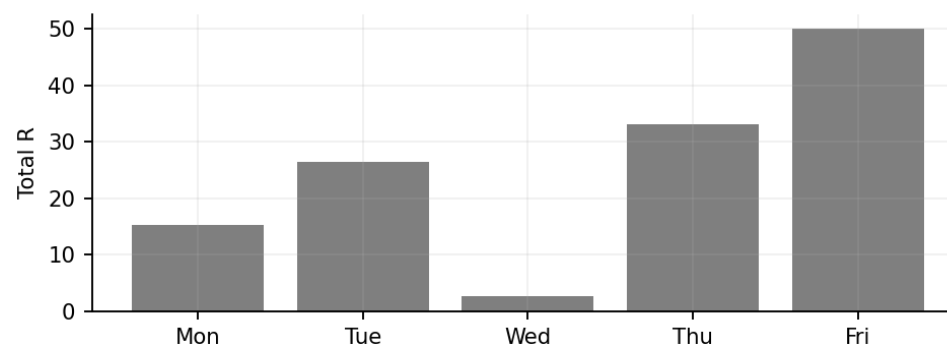

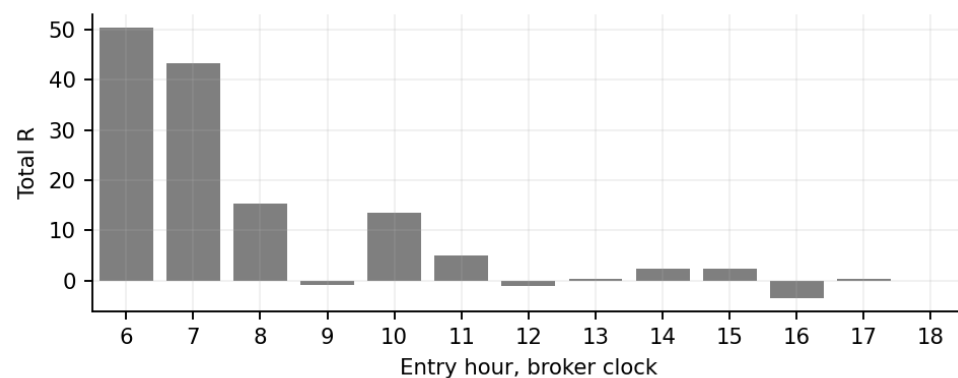

Positive months: 67/117. Positive weeks: 290/506 active weeks. Best month 2026-03: 15.37%; worst 2023-06: -4.69%. Blank heatmap cells are beyond the test end, not zero returns.

H | Trade behaviour and timing

Individual model study 3/4 | Entry-hour attribution is descriptive, not a validated new time filter

Group	Trades	Cash PF	Total R	Mean R	Win %
buy	1289	1.406	95.37	0.074	52.91
sell	1190	1.100	32.29	0.027	48.49
SL	305	0.000	-303.32	-0.994	0.00
EOD	2173	2.829	431.25	0.198	57.94
OTHER	1	0.000	-0.27	-0.275	0.00

Avg winner R	Avg loser R	Win streak	Loss streak	Avg holding h	Worst trade %	Best trade %
0.57	-0.49	14	11	10.64	-1.12	5.01

SL classification uses the MT5 closing-deal comment; EOD classification uses an 18:55 exit timestamp. OTHER remains explicit. Total R by hour/weekday reflects both trade frequency and payoff; small buckets are not strong evidence for another filter. No new hour mask was optimized.

H | Drawdown, tail risk and robustness

Individual model study 4/4 | Historical losses are observations, not upper bounds

Peak	Trough	Recovery	Days	Balance DD %
2023-01-06	2023-09-13	2024-04-05	455	11.24
2019-03-18	2019-10-22	2020-04-17	396	12.46
2022-06-03	2022-10-14	2022-12-28	208	6.95

Daily Sharpe	Sortino	Ann. vol %	Daily VaR95 %	Daily ES95 %
1.151	1.929	11.06	1.00	1.00

Bootstrap block	Median DD %	DD95 %	DD99 %	CAGR5 %
5	14.85	24.04	29.86	7.24
20	15.45	24.49	28.48	7.03

Extra USD / round-trip lot	Net profit \$	Cash PF	Mean R
0	237,127	1.240	0.051
7	223,603	1.224	0.048
20	198,488	1.197	0.040
27	184,964	1.182	0.037

Top 1/5/10 cash winners contribute 5.59% / 21.70% / 35.50% of net profit. Top 10 R winners contribute 27.26% of total R; mean R after removing them is 0.038. Removal is a diagnostic, not a realistic replacement backtest.

Recovery rows are the three longest episodes, measured peak-to-recovery (or test end). Bootstrap uses 2,000 circular 5/20-weekday blocks, preserving short dependence; it is conditional on this history. Additional cost tests subtract costs at original recorded volumes without rerunning position sizing.

Rolling returns and prolonged weak periods

63 / 126 / 252 weekday observations approximate 3 / 6 / 12 months

ID	Worst 3m %	Worst 6m %	Worst 12m %	Positive 12m windows %	Longest recovery days
A	-18.07	-18.99	-23.35	84.75	552
B	-13.73	-14.36	-17.60	85.45	552
C	-11.09	-11.54	-14.09	85.63	552
D	-9.80	-9.83	-10.36	84.66	432
E	-17.21	-21.02	-27.05	80.18	711
F	-20.97	-18.70	-22.34	82.02	704
G	-17.21	-20.85	-26.15	79.60	711
H	-8.07	-11.03	-9.52	81.01	455

A strategy can have a positive decade and still spend a long time below its peak. A lower drawdown depth does not automatically shorten the recovery. Rolling windows overlap heavily; their positive share is a descriptive statistic, not an independent success probability.

All eight variants share the same fundamental entry idea and Gold price exposure. Different stop widths change which reversals survive, but do not create an inverse ORB strategy. The ledger supports this shared-regime observation; no independent price-regime classification has been fitted to these eight runs.

Research verdict and next validation gates

Freeze a small shortlist instead of continuing to optimize the same history

Primary shortlist: D and C. Keep H as the alternative to D; B is a sizing alternative to C. If only one ORB slot is available and drawdown control is the priority, select D for the next validation phase. Do not describe D+C as two low-correlation systems.

Do not advance E/F/G merely because their win rate or PF looks attractive. Their observed equity DD stays near 33%, and the overall removed trades are profitable. Retain the simple unfiltered entry baseline within this eight-run decision.

Before deployment: freeze the source and .set files; confirm tester mode and symbol contract specifications; evaluate realistic commissions, spread and slippage; compare a small visual sample with logs; then collect untouched forward observations. The entire 2017-2026 sample has already been inspected and cannot be relabelled as fresh validation.

For a selected two-model allocation, validate the actual concurrent implementation and combined intraday equity, including margin and aggregate risk. Separate virtual sleeves and daily rebalancing do not by themselves establish executable netting or hedging behaviour.

No prop-firm pass/fail conclusion is made. These exports do not provide the combined floating equity path, and no specific firm's rules are part of this analysis. The observed drawdowns and bootstrap tails warrant a deliberate risk budget rather than assuming historical maxima are limits.

Methods, definitions and source traceability

Independent reconstruction; the source exports remain the authority for reported intratrade equity DD

CAGR = $(\text{ending balance} / \text{deposit})^{(365.25 / \text{elapsed calendar days})} - 1$, over 2017-01-01 to 2026-09-09. Calendar-year/month returns compound from opening to closing balance; they do not add. Weekly data uses Monday-Sunday periods, clipped to test dates.

Trade R = net trade P/L divided by entry balance x configured risk fraction. It is a budget-risk unit, not necessarily the exact rounded order-SL risk. Net P/L includes reported commission and swap. Positive-net wins are strictly greater than zero. Cash PF is positive net P/L divided by absolute negative net P/L; R PF uses R instead of dollars.

Balance DD includes initial deposit in the running peak. Relative equity DD is copied from its explicitly labelled MT5 field, not the percentage beside maximum dollar drawdown. CAGR / equity DD is labelled explicitly. Balance charts and portfolio drawdowns exclude unrealized intratrade fluctuations.

Daily returns use Mon-Fri closed balances, including inactive weekdays. Sharpe uses a zero benchmark and $\sqrt{252}$; Sortino uses root mean square of negative returns with zero downside on other days. Annualized volatility uses sample daily standard deviation. VaR/ES are empirical daily lower-tail loss statistics, not intraday limits.

Monte Carlo uses circular blocks of daily returns (2,000 resamples; single-model seed 19092026). Portfolio resampling uses synchronized combined daily observations (20-day blocks, seed 220926). Percentiles are conditional sensitivity estimates, not calibrated forecasts. Historical maximum DD and bootstrap DD are different quantities.

Cost stress uses extra USD 7/20/27 per round-trip lot at original volumes. Risk replay scales recorded returns and compounds them; it does not simulate fresh lots. Source files and all actual inputs are recorded in analysis.json inside the embedded ZIP. The ZIP also includes full cash ledgers and portfolio series for independent review.
