

Gold ORB: five timing variants

Research report | 1 January 2020–9 September 2026 | Prepared 19 September 2026

The time filter materially reduces observed drawdown. The strongest next-stage shortlist is C (0.25 ATR, 07:30) and E (0.65 ATR, 07:30), with B (0.25 ATR, 07:05) retained as a serious lower-drawdown challenger.

ID / stop / start	Net profit USD	CAGR	Equity DD	Research role
A / 0.25 06:05	110,398.72	45.06%	28.32%	Earlier-entry control
B / 0.25 07:05	112,575.12	45.45%	17.12%	Lower-DD challenger
C / 0.25 07:30	139,058.89	49.77%	20.10%	Return-led finalist
D / 0.65 06:05	21,489.01	18.71%	11.55%	Higher-return 0.65 control
E / 0.65 07:30	19,545.96	17.58%	10.60%	Lower-DD 0.65 finalist

Use the saved inputs, not the filename shorthand: “6–9” means 06:05–08:55, “7–9” means 07:05–08:55, and “7:30–9” means 07:30–08:55. The end is exclusive. These are broker-server times, not IST.

What matters for the decision

C has the highest ending balance (\$149,058.89), CAGR (49.77%) and mean budget R (0.251). B has materially lower historical equity drawdown: 17.12% versus C’s 20.10%. Calling B and C “almost the same” misses an important risk trade-off.

For 0.65 ATR, E reduces equity drawdown to 10.60% from D’s 11.55%, and shortens the longest balance recovery from 640 to 379 days. D still earns more and has more positive months. E is a risk-led choice, not the winner on every metric.

The rankings come from a sample already used to select settings. They support a controlled range-filter experiment; they do not establish a uniquely optimal time window or a future drawdown ceiling.

Five supplied MT5 exports; \$10,000 starting balance each; 1% balance risk setting. Returns are backtested, compounded account results. This report includes individual variant reviews, full monthly and weekly returns, annual statistics, entry-hour attribution, costs and resampling checks.

Configuration and reconciliation

The five exports form a controlled timing comparison

ID	Supplied file	Actual entry window
A	ORB_6-9_20-26_025ATR.xlsx	06:05-08:55
B	OBR_7-9_20-26_025ATR.xlsx	07:05-08:55
C	ORB_730-9_20-26_025ATR.xlsx	07:30-08:55
D	OBR_6-9_20-26_65ATR.xlsx	06:05-08:55
E	OBR_730-9_20-26_65ATR.xlsx	07:30-08:55

Setting / check	Observed value
EA / market / account	ORB_V3_CUTOFF; XAUUSD; USD 10,000; 1:100; ICMarketsSC-Demo; build 6182.
Test and history	M15 header; 2020.01.01-2026.09.09; 99% history quality; 158,082 bars and 282,827,485 ticks in every file.
Range and exit	Range 03:05-06:05; daily close 18:55; one entry per day.
Signal and risk	M5 signal; touch entry; 0.05 signal-ATR breakout buffer; D1 ATR(14) stop reference; 0.25 or 0.65 stop multiplier; 1% balance risk.
Filters	New entry-time filter ON. Legacy cutoff, both range filters, strong-candle filter and holding/Friday overrides OFF.
Inactive differences	ATR range bounds differ between some files, but the range filter is OFF. These values do not define active treatment differences.
Ledger reconstruction	Every entry matched to its exit; no unmatched trades, overlapping positions, duplicate deals or more than one entry per day.
Financial checks	Net profit, gross profit/loss, final balance and each deal balance reconcile to cents. Reconstructed maximum balance DD matches reported rounding.
Timing checks	Every recorded entry is within its configured window. Same-time 0.25 and 0.65 variants share entry timestamps, directions and filled entry prices.
Costs and limitations	All exported commission and swap values are zero. Spread/slippage can be embedded in prices. Tick-path equity and rejected signals are not in the deal ledger.

The reported history quality does not alone certify execution realism. Test-end coverage is retained even where a variant's final trade is earlier. No broker-to-IST conversion is assumed without the server's historical UTC/DST policy.

Performance dashboard

Returns and risk measured consistently across all five runs

Metric	A	B	C	D	E
Closed trades	1,271	1,186	1,149	1,271	1,149
Net profit, USD	110,398.72	112,575.12	139,058.89	21,489.01	19,545.96
Ending balance, USD	120,398.72	122,575.12	149,058.89	31,489.01	29,545.96
CAGR, %	45.06	45.45	49.77	18.71	17.58
Cash profit factor	1.404	1.424	1.430	1.356	1.352
Win rate, %	39.50	39.46	40.03	52.71	52.31
Mean budget R / trade	0.211	0.227	0.251	0.093	0.097
Total budget R	268.03	269.48	288.86	118.48	111.83
Budget-R profit factor	1.374	1.404	1.451	1.371	1.385
Max balance DD, %	27.26	15.75	18.66	10.69	9.77
MT5 relative equity DD, %	28.32	17.12	20.10	11.55	10.60
CAGR / equity DD	1.59	2.66	2.48	1.62	1.66
Daily Sharpe	1.63	1.65	1.78	1.64	1.61
Daily Sortino	3.85	4.01	4.38	2.92	2.88
Annualized daily volatility, %	23.71	23.51	23.39	10.42	10.02

A: 0.25 / 06:05 · B: 0.25 / 07:05 · C: 0.25 / 07:30 · D: 0.65 / 06:05 · E: 0.65 / 07:30. All entries end before 08:55; broker time.

The narrow stop produces roughly twice the account volatility of the wider stop, despite the shared 1% risk setting. A tighter stop changes trade survival and payoff size in R. Comparing equal settings therefore does not mean comparing equal realized volatility.

The return-to-observed-equity-DD ratio is strongest for B among the narrow-stop runs. C leads on CAGR, daily Sharpe and mean R. D has a slightly higher Sharpe and CAGR than E. These differences justify explicit risk-versus-return preferences rather than a single score chosen after seeing the results.

CAGR uses the full configured 2,443-day span (ACT/365.25). Daily metrics use weekday closed-balance returns including no-trade days, with zero risk-free/target return and 252-day annualization. They are not MT5's built-in Sharpe statistic.

Change from the unfiltered baseline

Same 2020–2026 span; earlier supplied ORBGOLD exports

Stop / version	Trades	Net USD	CAGR	Equity DD
0.25 / no entry filter	1697	115,274.47	45.93%	33.57%
A / 0.25 06:05	1271	110,398.72	45.06%	28.32%
B / 0.25 07:05	1186	112,575.12	45.45%	17.12%
C / 0.25 07:30	1149	139,058.89	49.77%	20.10%
0.65 / no entry filter	1697	21,635.79	18.79%	13.11%
D / 0.65 06:05	1271	21,489.01	18.71%	11.55%
E / 0.65 07:30	1149	19,545.96	17.58%	10.60%

Against the 0.25 baseline, B cuts reported equity drawdown by 16.45 percentage points (49.0% relative) with slightly lower net profit. C cuts it by 13.47 points (40.1% relative) while raising net profit by \$23,784.42. A improves drawdown only to 28.32% and also earns less than the baseline.

Against the 0.65 baseline, E cuts equity drawdown by 2.51 points (19.1% relative), at the cost of \$2,089.83 net profit. D retains almost all baseline profit while reducing drawdown by 1.56 points. The 0.65 decision is consequently much closer than the narrow-stop decision.

Interpretation

The baseline exports use the same configured period and report the same bars, ticks and 99% history quality. They are the relevant numerical reference for these five tests. The separate 2017–2026 report is a different span and is not mixed into this comparison.

This is an EA-version comparison as well as a time-filter comparison (V2 versus V3). Saved active settings align, but source-code equivalence beyond the time-filter change has not been independently re-audited for this report. Treat the baseline as a useful research reference rather than a randomized causal estimate.

Baseline sources: ORBGOLD_025.xlsx and ORBGOLD_065.xlsx, previously supplied and their headers checked for this report. All headline equity DD values use the MT5 relative percentage field.

Calendar-year comparison

Six complete years plus partial 2026; returns are not annualized within a year

Year	A	B	C	D	E
2020	28.31%	26.88%	39.65%	13.97%	11.39%
2021	89.13%	78.84%	90.40%	47.89%	45.18%
2022	38.90%	46.53%	54.26%	3.32%	10.82%
2023	-12.41%	9.65%	19.29%	-0.84%	6.42%
2024	56.23%	42.54%	42.07%	31.37%	23.08%
2025	80.07%	60.31%	54.22%	23.70%	17.57%
2026*	44.96%	47.13%	39.04%	12.21%	7.06%

Cash profit factor by year

Year	A	B	C	D	E
2020	1.231	1.247	1.390	1.290	1.281
2021	1.516	1.514	1.570	1.899	1.903
2022	1.264	1.326	1.382	1.052	1.184
2023	0.890	1.090	1.190	0.984	1.142
2024	1.403	1.336	1.351	1.622	1.487
2025	1.575	1.459	1.434	1.424	1.346
2026*	1.630	1.749	1.631	1.427	1.267

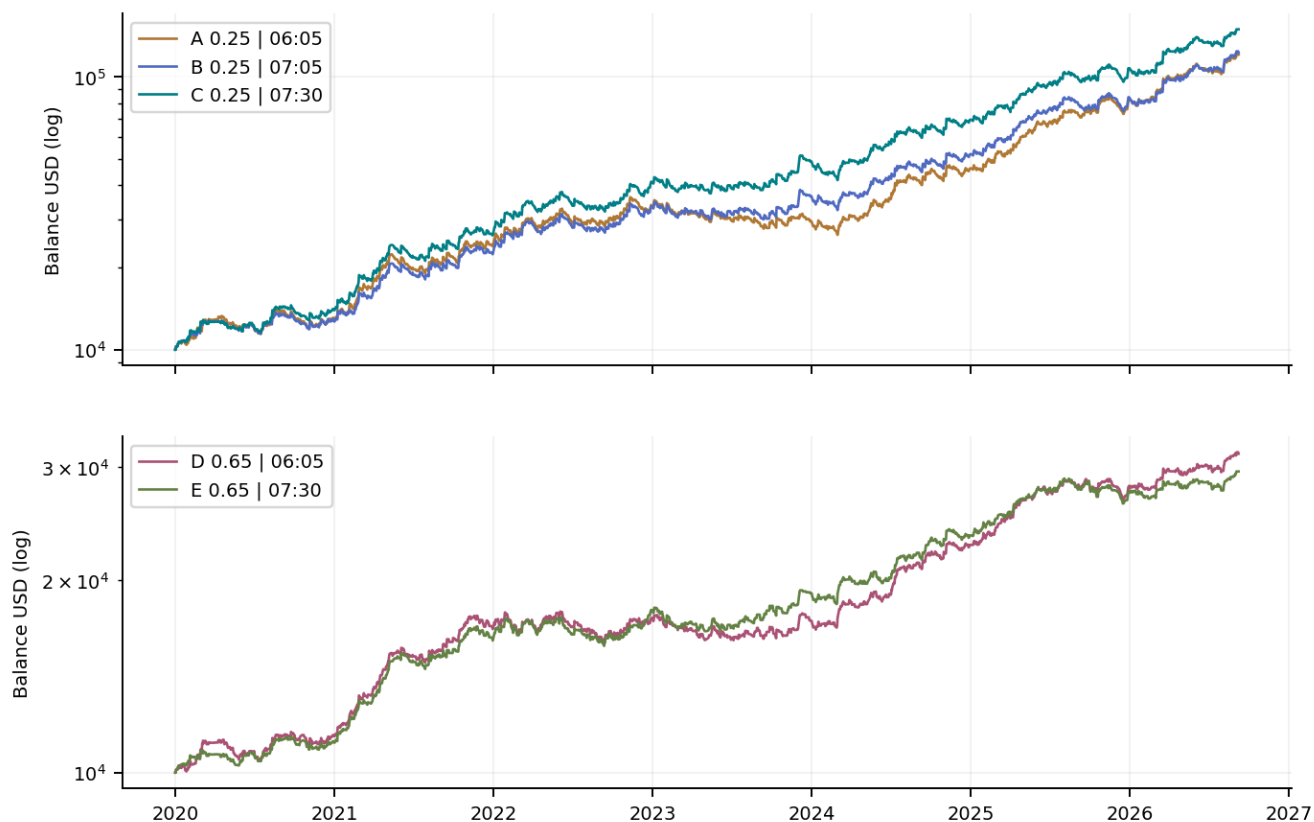

B, C and E are positive in every displayed calendar year; A and D lose in 2023. C's advantage over B is concentrated in 2020–2023. B beats C in 2024, 2025 and 2026 YTD, so the best full-sample setting is not the recent-period winner.

Within 0.65, E improves 2022 and turns 2023 positive, but D leads in 2020, 2021 and 2024–2026. The later start appears to help specific difficult regimes rather than improving all environments.

A: 0.25 / 06:05 · B: 0.25 / 07:05 · C: 0.25 / 07:30 · D: 0.65 / 06:05 · E: 0.65 / 07:30. All entries end before 08:55; broker time. * 2026 includes data only to 9 September. Yearly returns compound; their arithmetic sum is not the full-period return.

Balance growth through time

Separate panels prevent the smaller 0.65 account paths being visually compressed

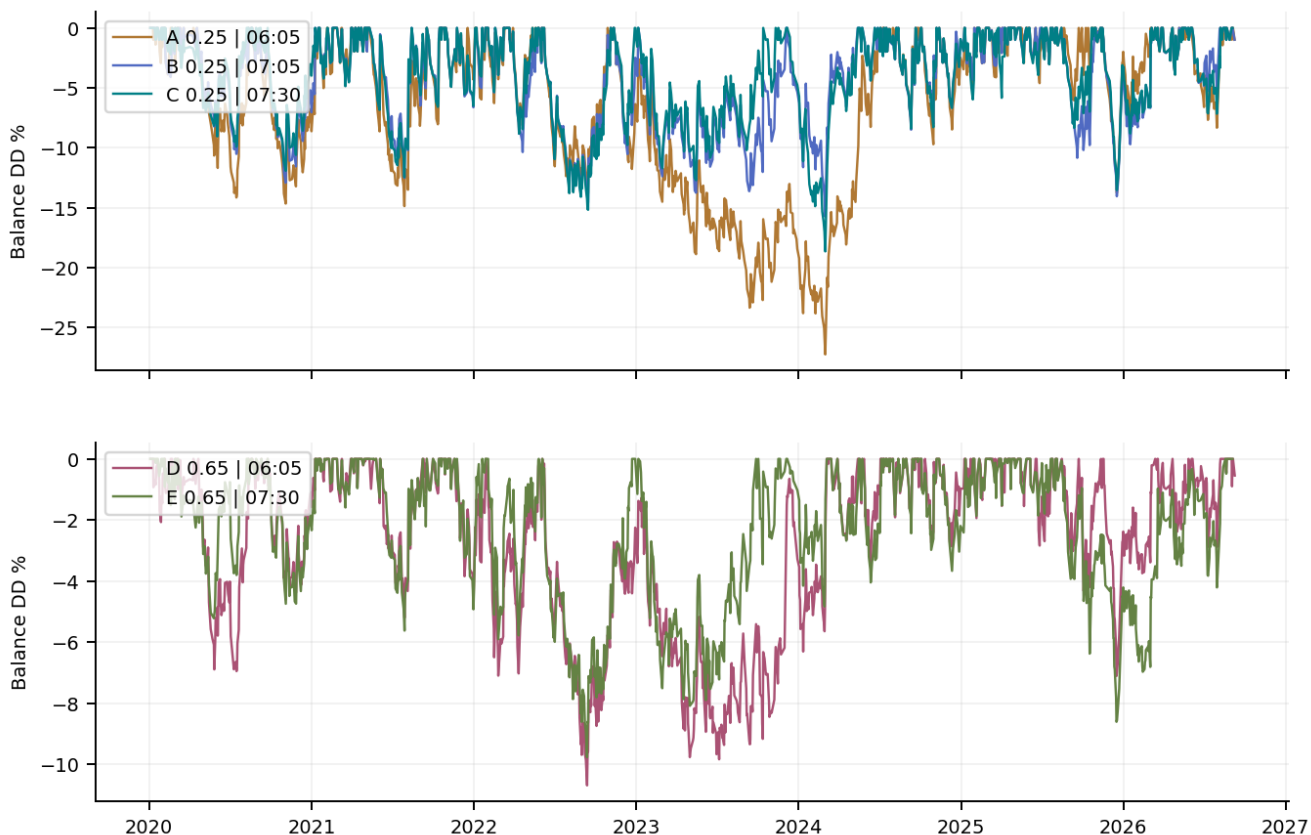

The broad upward trend is shared. The divergence between the narrow-stop variants becomes substantial during the 2022–2024 difficult period. C's higher terminal balance partly reflects gains accumulated earlier and compounded later; cash profit should therefore be read alongside mean R and calendar returns.

Logarithmic vertical axes show proportional growth. Curves are reconstructed closed balances, not intratrade equity. All accounts begin at \$10,000 with the same percentage-risk input.

Drawdown and time to recovery

Lower drawdown depth does not guarantee a short wait for a new high

ID	Balance DD	Equity DD	Longest recovery	Peak → recovery
A	27.26%	28.32%	600 days	2022-11-11 → 2024-07-03
B	15.75%	17.12%	333 days	2023-01-05 → 2023-12-04
C	18.66%	20.10%	281 days	2023-01-05 → 2023-10-13
D	10.69%	11.55%	640 days	2022-06-03 → 2024-03-04
E	9.77%	10.60%	379 days	2025-08-04 → 2026-08-18

B and C improve the long stagnation visible in A. E also improves D's 640-day recovery, but its longest recovery is still 379 calendar days. Lower-volatility systems can remain under their previous peak for a long time.

Recovery is measured from a closed-balance peak to the first subsequent balance at or above it, including weekends. The longest episode need not be the deepest. Equity percentages come from MT5; the ledger cannot reconstruct floating-equity recovery paths.

Consistency beyond annual returns

Monthly, weekly and rolling windows reveal the difficult parts of the sample

Metric	A	B	C	D	E
Positive months	51 / 81	51 / 81	53 / 81	56 / 81	48 / 81
Best months return	23.63%	20.90%	24.94%	10.45%	10.55%
Worst months return	-8.14%	-7.38%	-9.29%	-6.16%	-5.68%
Positive weeks	183 / 350	185 / 350	187 / 350	201 / 350	200 / 350
Best weeks return	13.12%	13.65%	14.70%	5.26%	5.29%
Worst weeks return	-5.00%	-4.97%	-4.99%	-2.88%	-3.09%

3-month approximate rolling performance

Metric	A	B	C	D	E
Worst return	-15.09%	-15.08%	-18.01%	-9.69%	-8.61%
Best return	57.59%	52.70%	53.89%	24.44%	23.07%
Positive windows	74.38%	78.83%	81.33%	72.41%	73.72%

6-month approximate rolling performance

Metric	A	B	C	D	E
Worst return	-17.14%	-10.76%	-9.36%	-8.41%	-8.66%
Best return	82.28%	70.42%	84.65%	40.00%	39.87%
Positive windows	84.37%	91.72%	95.55%	81.78%	84.19%

12-month approximate rolling performance

Metric	A	B	C	D	E
Worst return	-20.40%	-7.34%	2.55%	-8.23%	-4.15%
Best return	103.25%	98.75%	112.34%	58.32%	55.04%
Positive windows	86.87%	99.06%	100.00%	83.79%	93.64%

E has 48 positive months versus D's 56, even though E has a shallower maximum drawdown. C has the strongest positive-month count among the narrow-stop variants. A high positive-week fraction is not enough to rank expected return: payoff size also matters.

Rolling windows are 63/126/252 weekdays, overlap, and are not independent samples. Calendar counts retain no-trade and partial periods. Full exact monthly and weekly returns and trade counts appear in the appendices.

Trade behaviour and concentration

Budget R makes trades comparable as account size grows

Metric	A	B	C	D	E
Mean winner, USD	763.70	807.48	1,005.56	122.05	124.90
Mean loser, USD	-354.98	-369.53	-469.52	-100.30	-101.32
Longest loss streak	10	17	16	7	9
Mean holding hours	8.56	8.07	7.95	11.31	10.52
Worst trade balance return, %	-1.20	-1.25	-1.24	-1.00	-1.00
Average planned SL risk, %	0.985	0.986	0.988	0.934	0.934
Top 10 cash winners / net, %	42.29	42.93	44.18	30.01	32.50
Mean R after top 10 R removed	0.151	0.159	0.181	0.070	0.071

ID	Wins / losses	SL / daily-close exits	Buy PF / mean R	Sell PF / mean R
A	502 / 769	705 / 566	1.409 / 0.202	1.399 / 0.221
B	468 / 718	658 / 528	1.413 / 0.197	1.436 / 0.260
C	460 / 689	629 / 520	1.410 / 0.216	1.450 / 0.291
D	670 / 601	211 / 1060	1.457 / 0.108	1.259 / 0.077
E	601 / 548	192 / 957	1.421 / 0.105	1.284 / 0.088

B and C experience longer losing streaks than A despite their lower maximum drawdown. The path and size of the intervening winners matter. The wide stop keeps more trades alive until the 18:55 daily close, explaining its longer holding times and higher win rate.

Removing each run's ten largest R winners leaves positive average R in all five. This is a useful concentration diagnostic, not an executable strategy or a compounded counterfactual. Cash concentration is high for 0.25 because later profits are earned on larger balances.

Simple R example: if balance before entry is \$10,000, the 1% risk budget is \$100. A \$200 net winner is +2 budget R; an \$80 loss is -0.8 budget R. Here R uses the budget, not the exact stop-distance risk after volume rounding.

All trades close on their entry date; there are no breakeven trades. Planned risk is inferred from entry-to-initial-SL distance and volume, with the contract multiplier reconciled to recorded P&L.; Actual losses can exceed planned risk through execution effects.

What delaying entry actually changes

A later-start backtest is not the same as deleting early rows from an earlier-start ledger

Comparison	Common days	Omitted earlier days	Changed entry times	Changed direction
A → B	1,186	85	643	21
A → C	1,149	122	737	34
B → C	1,149	37	595	13
D → E	1,149	122	737	34

Comparison	Earlier R on omitted days	Later – earlier R on common days	Total R change
A → B	–34.52	–33.08	+1.44
A → C	–61.72	–40.89	+20.83
B → C	–27.39	–8.01	+19.39
D → E	–18.62	–25.28	–6.65

For A → C, avoiding the 122 omitted days removes –61.72 R, while changed outcomes on the 1,149 common days cost 40.89 R. The net improvement is 20.83 R. The benefit is therefore not that waiting improves every breakout; the omitted opportunities explain a large part of the improvement.

For D → E, omitting weak days helps, but the deterioration on common days is larger. Total R falls by 6.65 even though R per trade improves. This explains why the later 0.65 setting can look cleaner yet earn less.

At the start of the permitted window

Entries in the first permitted clock minute number 91 for A/D, 346 for B and 442 for C/E. This clustering is consistent with entry becoming eligible when price is already beyond a breakout line. The export alone cannot prove the preceding price path for every trade. A tick-level EA replay is needed to distinguish fresh crossings from already-outside entries.

Matched days use calendar entry date. All later-start trade days are subsets of the corresponding earlier-start days in these exports. Paired R attribution is descriptive, not randomized or independent of previously selected settings. Minor differences reflect rounding.

Entry-hour attribution

All clock hours accounted for; observed activity is confined to 06:00–08:54

ID	Entry hour	Trades	Net USD	Cash PF	Mean R
A	06:00	700	43,701.11	1.273	0.157
A	07:00	341	37,169.28	1.554	0.245
A	08:00	230	29,528.33	1.642	0.325
B	07:00	875	73,092.32	1.369	0.194
B	08:00	311	39,482.80	1.589	0.321
C	07:00	794	90,696.16	1.397	0.246
C	08:00	355	48,362.73	1.509	0.262
D	06:00	700	9,090.86	1.260	0.075
D	07:00	341	6,606.22	1.422	0.105
D	08:00	230	5,791.93	1.596	0.132
E	07:00	794	11,490.49	1.287	0.087
E	08:00	355	8,055.47	1.519	0.121

Hours 00–05 and 09–23 have zero entries and zero attributed profit in every variant. Hour 06 is also empty for B, C and E. Hour 07 starts at 07:05 for B and 07:30 for C/E; hour 08 stops before 08:55 for all variants.

Attribute the whole trade’s result to its entry hour, even when the exit occurs much later. These figures answer “which entry cohorts made money?” They do not estimate the outcome of shifting a cutoff, because the EA may place a different trade after eligibility changes.

Broker-server time throughout. Cash totals are affected by account compounding; mean R is the cleaner comparison across entry cohorts. No new hour-by-hour optimization is recommended from this already-filtered sample.

Day-of-week attribution

Diagnostic only; avoid adding another filter merely because one weekday ranks lowest

Mean budget R per trade

Day	A	B	C	D	E
Monday	0.049	0.081	0.091	0.032	0.017
Tuesday	0.297	0.284	0.322	0.122	0.140
Wednesday	0.034	0.057	0.041	0.046	0.043
Thursday	0.352	0.345	0.417	0.136	0.135
Friday	0.317	0.362	0.376	0.128	0.149

Net profit, USD

Day	A	B	C	D	E
Monday	11,434.64	13,409.32	20,444.58	1,675.16	1,107.99
Tuesday	36,150.88	37,320.58	48,109.31	5,404.86	5,906.03
Wednesday	5,128.14	8,421.26	7,705.76	2,964.67	2,502.94
Thursday	29,869.89	30,586.86	36,321.05	6,337.93	5,212.78
Friday	27,815.17	22,837.10	26,478.19	5,106.39	4,816.22

Monday	245	230	224	245	224
Tuesday	245	234	224	245	224
Wednesday	259	238	230	259	230
Thursday	257	246	236	257	236
Friday	265	238	235	265	235

A: 0.25 / 06:05 · B: 0.25 / 07:05 · C: 0.25 / 07:30 · D: 0.65 / 06:05 · E: 0.65 / 07:30. All entries end before 08:55; broker time.

Weekday groupings pool different years and market regimes. Differences are exploratory and have not been adjusted for the many candidate settings already examined. Use them to locate anomalies for validation, not as an automatic instruction to remove a weekday.

Cost sensitivity

Hypothetical extra cost per round-trip lot, applied to the exported filled volumes

Additional \$7 per lot per completed trade

ID	Adjusted net USD	Cash PF	Mean R
A	106,730.44	1.388	0.202
B	108,999.80	1.407	0.218
C	134,749.62	1.413	0.242
D	20,745.26	1.342	0.090
E	18,865.42	1.338	0.094

Additional \$20 per lot per completed trade

ID	Adjusted net USD	Cash PF	Mean R
A	99,917.92	1.357	0.184
B	102,359.92	1.377	0.201
C	126,746.69	1.383	0.225
D	19,364.01	1.316	0.083
E	17,601.56	1.312	0.088

Additional \$27 per lot per completed trade

ID	Adjusted net USD	Cash PF	Mean R
A	96,249.64	1.342	0.175
B	98,784.60	1.361	0.192
C	122,437.42	1.367	0.216
D	18,620.26	1.302	0.080
E	16,921.02	1.298	0.084

All five retain positive net profit under these arithmetic cost stresses. Narrow stops generally use larger volume for the same risk budget, so an added per-lot charge consumes more R. This matters when comparing 0.25 and 0.65.

These are analyst-selected stresses, not quoted broker prices. Calculation: adjusted P&L; = recorded net P&L; – cost × filled lots. Volumes, entry choices and balances used for R remain those of the original run; this is not a compounded rerun. Commission and swap are zero in the exports; do not assume total execution costs were zero or double-count an already embedded spread.

Resampling stress and correlation

Observed maximum drawdown is not a forecast ceiling

ID	Observed balance DD	20-day block median DD	95th-percentile DD	99th-percentile DD	5th-percentile CAGR
A	27.26%	21.14%	32.11%	38.97%	26.13%
B	15.75%	19.88%	31.23%	36.86%	27.16%
C	18.66%	19.38%	30.65%	35.73%	30.37%
D	10.69%	10.86%	17.99%	21.39%	10.85%
E	9.77%	10.78%	17.57%	21.10%	10.09%

The resampled 95th-percentile balance drawdown is about 31% for B/C and 18% for D/E. B's observed 15.75% balance drawdown should therefore not be treated as a reliable upper bound. B's observed risk lead over C also does not persist in every resampling statistic.

2,000 circular moving-block resamples per run and block size (5 and 20 weekdays); seed 19092026. The full aligned weekday return series, including zero-return days, is resampled and compounded for the same horizon. Blocks retain some short-run dependence, but not structural regime change. No floating equity, future costs or parameter-selection adjustment is included. Percentiles describe this model, not calibrated future probabilities.

Daily closed-balance return correlation

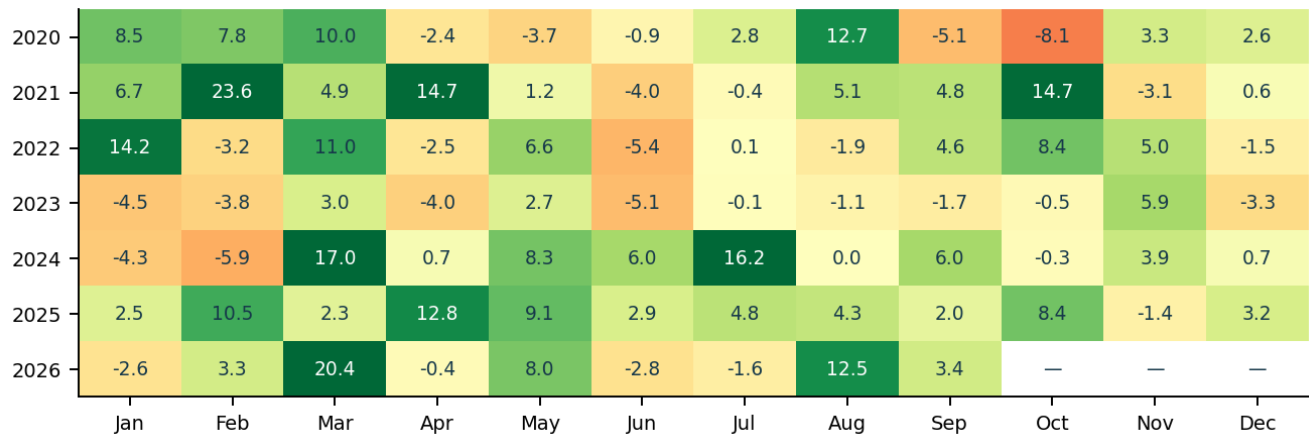

ID	A	B	C	D	E
A	1.000	0.921	0.912	0.824	0.787
B	0.921	1.000	0.974	0.800	0.837
C	0.912	0.974	1.000	0.792	0.849
D	0.824	0.800	0.792	1.000	0.925
E	0.787	0.837	0.849	0.925	1.000

B and C correlate at 0.974; D and E at 0.925. Across stop sizes, correlations are also high. These are related versions of the same Gold ORB exposure. Running both at full standalone risk does not create two independent systems.

No combination portfolio has been simulated here. A combined allocation requires explicit account-level sizing, simultaneous-position handling and a joint equity/cost backtest.

A: 0.25 | 06:05-08:55

Individual review | Calendar return heatmap and exact annual statistics

Year	Trades	Net USD	Return	PF	Mean R	Local bal. DD
2020	171	2,830.87	28.31%	1.231	0.160	14.66%
2021	191	11,435.60	89.13%	1.516	0.354	14.88%
2022	202	9,439.89	38.90%	1.264	0.178	13.81%
2023	187	-4,182.60	-12.41%	0.890	-0.058	21.34%
2024	200	16,600.05	56.23%	1.403	0.238	11.49%
2025	195	36,932.50	80.07%	1.575	0.316	13.78%
2026*	125	37,342.41	44.96%	1.630	0.310	8.33%

Three longest balance recovery episodes

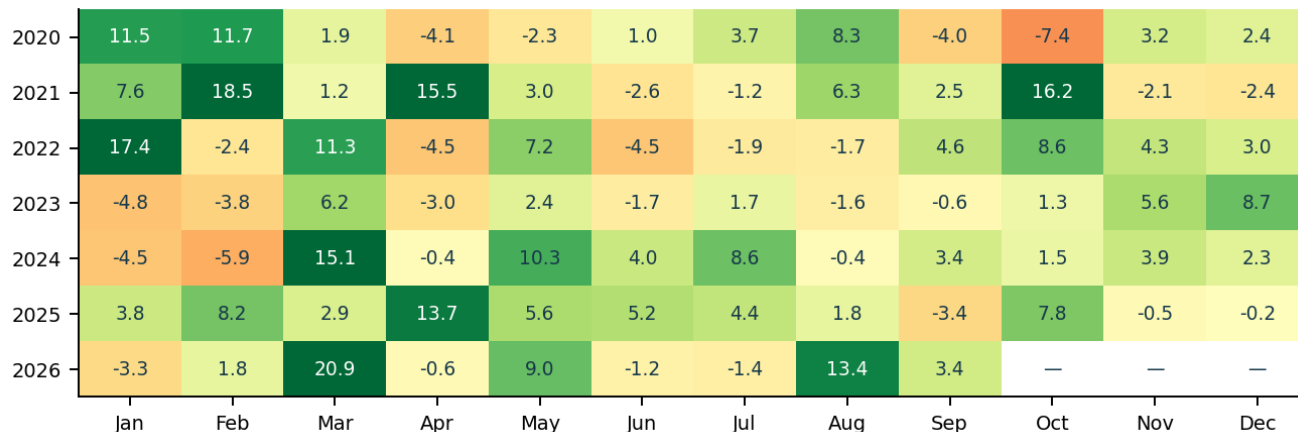

Peak	Trough	Recovery / end	Days	Depth
2022-11-11	2024-03-01	2024-07-03	600	27.26%
2020-08-19	2020-11-03	2021-01-18	152	14.66%
2022-06-07	2022-09-14	2022-10-28	143	13.81%

A remains profitable, but its 27.26% balance DD and 600-day recovery make it the weakest narrow-stop candidate for the current drawdown objective. It retains stronger 2024–2026 yearly returns than C, so preserve it as a control rather than declaring the early session permanently inferior.

Heatmap numbers are monthly percentages; colors cap at $\pm 15\%$. Dashes are outside the test horizon; September 2026 is partial. Annual local DD resets the peak at the year's opening balance, so it is not the full account's ongoing high-water-mark DD. * 2026 is YTD.

B: 0.25 | 07:05-08:55

Individual review | Calendar return heatmap and exact annual statistics

Year	Trades	Net USD	Return	PF	Mean R	Local bal. DD
2020	156	2,688.18	26.88%	1.247	0.167	12.93%
2021	176	10,003.26	78.84%	1.514	0.350	12.52%
2022	192	10,558.99	46.53%	1.326	0.215	14.58%
2023	174	3,210.05	9.65%	1.090	0.070	13.76%
2024	188	15,508.98	42.54%	1.336	0.204	11.64%
2025	184	31,342.06	60.31%	1.459	0.271	14.05%
2026*	116	39,263.60	47.13%	1.749	0.347	5.71%

Three longest balance recovery episodes

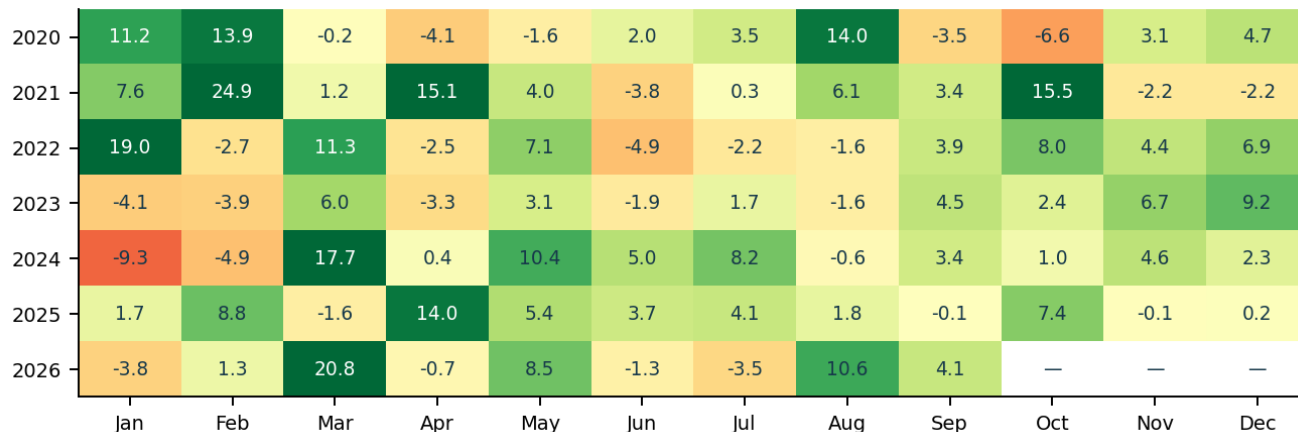

Peak	Trough	Recovery / end	Days	Depth
2023-01-05	2023-05-15	2023-12-04	333	13.76%
2023-12-06	2024-03-01	2024-05-13	159	15.75%
2022-06-07	2022-09-14	2022-11-04	150	14.58%

B is the important risk challenger: 17.12% reported equity DD versus C's 20.10%, with a similar cash PF. Its 2024-2026 calendar returns beat C. The 17-trade losing streak is a reminder that shallower account drawdown does not mean fewer consecutive losses.

Heatmap numbers are monthly percentages; colors cap at $\pm 15\%$. Dashes are outside the test horizon; September 2026 is partial. Annual local DD resets the peak at the year's opening balance, so it is not the full account's ongoing high-water-mark DD. * 2026 is YTD.

C: 0.25 | 07:30-08:55

Individual review | Calendar return heatmap and exact annual statistics

Year	Trades	Net USD	Return	PF	Mean R	Local bal. DD
2020	148	3,965.14	39.65%	1.390	0.241	11.93%
2021	173	12,625.06	90.40%	1.570	0.393	12.46%
2022	189	14,428.25	54.26%	1.382	0.246	15.19%
2023	166	7,911.25	19.29%	1.190	0.124	12.71%
2024	180	20,587.15	42.07%	1.351	0.210	14.59%
2025	180	37,689.45	54.22%	1.434	0.255	13.54%
2026*	113	41,852.59	39.04%	1.631	0.305	7.16%

Three longest balance recovery episodes

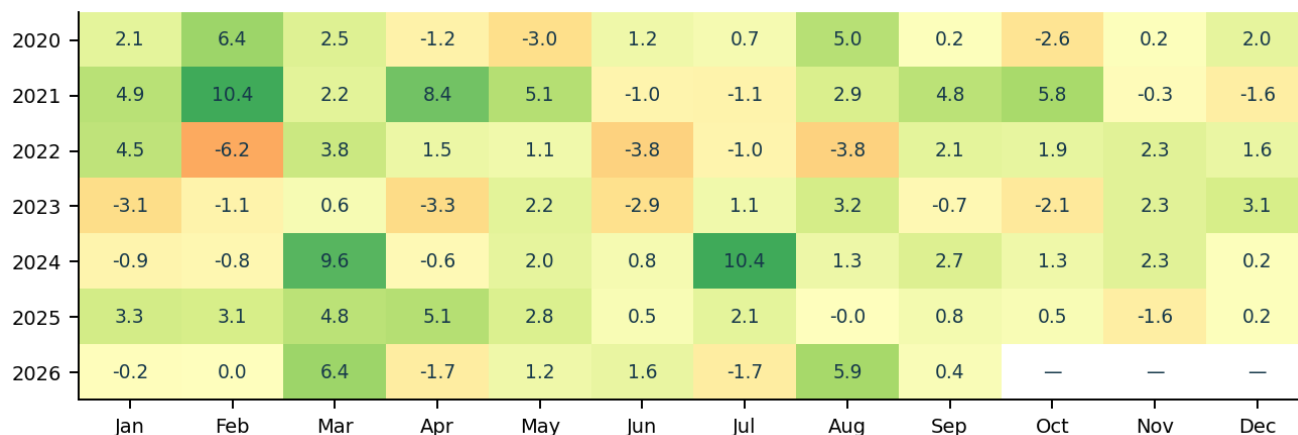

Peak	Trough	Recovery / end	Days	Depth
2023-01-05	2023-05-15	2023-10-13	281	12.71%
2023-12-06	2024-03-01	2024-05-13	159	18.66%
2020-03-05	2020-07-15	2020-08-07	155	9.92%

C leads full-period return, mean R and daily Sharpe, and has the shortest longest recovery among the five (281 days). Its advantage over B is front-loaded into 2020–2023. Keep that concentration visible when testing an additional range filter.

Heatmap numbers are monthly percentages; colors cap at $\pm 15\%$. Dashes are outside the test horizon; September 2026 is partial. Annual local DD resets the peak at the year's opening balance, so it is not the full account's ongoing high-water-mark DD. * 2026 is YTD.

D: 0.65 | 06:05-08:55

Individual review | Calendar return heatmap and exact annual statistics

Year	Trades	Net USD	Return	PF	Mean R	Local bal. DD
2020	171	1,396.81	13.97%	1.290	0.079	6.95%
2021	191	5,457.74	47.89%	1.899	0.208	5.21%
2022	202	560.14	3.32%	1.052	0.019	10.69%
2023	187	-146.04	-0.84%	0.984	-0.001	8.67%
2024	200	5,416.54	31.37%	1.622	0.139	3.51%
2025	195	5,376.43	23.70%	1.424	0.112	7.11%
2026*	125	3,427.39	12.21%	1.427	0.094	2.89%

Three longest balance recovery episodes

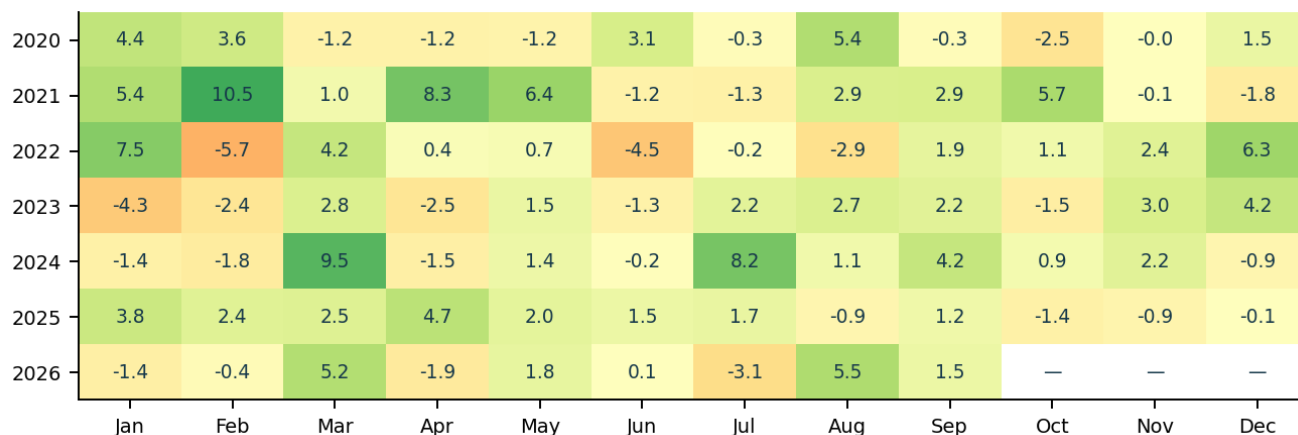

Peak	Trough	Recovery / end	Days	Depth
2022-06-03	2022-09-12	2024-03-04	640	10.69%
2022-01-27	2022-02-24	2022-06-03	127	7.10%
2025-11-17	2025-12-16	2026-03-13	116	7.11%

D earns more than E, has more positive months and a slightly higher daily Sharpe. Its central weakness is the 640-day balance recovery spanning 2022–2024. A low maximum DD alone would conceal this prolonged stagnation.

Heatmap numbers are monthly percentages; colors cap at $\pm 15\%$. Dashes are outside the test horizon; September 2026 is partial. Annual local DD resets the peak at the year's opening balance, so it is not the full account's ongoing high-water-mark DD. * 2026 is YTD.

E: 0.65 | 07:30-08:55

Individual review | Calendar return heatmap and exact annual statistics

Year	Trades	Net USD	Return	PF	Mean R	Local bal. DD
2020	148	1,139.36	11.39%	1.281	0.076	5.22%
2021	173	5,032.32	45.18%	1.903	0.219	5.62%
2022	189	1,749.05	10.82%	1.184	0.058	9.77%
2023	166	1,151.08	6.42%	1.142	0.041	8.09%
2024	180	4,401.81	23.08%	1.487	0.118	4.05%
2025	180	4,123.42	17.57%	1.346	0.093	8.61%
2026*	113	1,948.92	7.06%	1.267	0.063	3.89%

Three longest balance recovery episodes

Peak	Trough	Recovery / end	Days	Depth
2025-08-04	2025-12-16	2026-08-18	379	8.61%
2023-01-05	2023-05-01	2023-09-27	265	8.09%
2022-06-03	2022-09-12	2022-12-22	202	9.77%

E has the lowest reported equity DD of the five and improves D's difficult 2022–2023 period. It sacrifices overall return, has fewer positive months and trails D in recent annual returns. Select it for the risk/recovery trade-off, not because it dominates D.

Heatmap numbers are monthly percentages; colors cap at $\pm 15\%$. Dashes are outside the test horizon; September 2026 is partial. Annual local DD resets the peak at the year's opening balance, so it is not the full account's ongoing high-water-mark DD. * 2026 is YTD.

Decision and next experiment

Freeze a small shortlist before adding range-filter degrees of freedom

Candidate	Decision now	Why
C: 0.25 / 07:30	Primary narrow-stop candidate	Highest full-period return and mean R; shorter historical recovery.
B: 0.25 / 07:05	Retain as risk challenger	Materially lower observed DD; stronger recent annual returns than C.
E: 0.65 / 07:30	Primary wide-stop candidate	Lowest historical DD and better recovery than D.
D: 0.65 / 06:05	Keep as benchmark	Higher return and more positive months than E.
A: 0.25 / 06:05	Lower-priority benchmark	Largest remaining DD and long recovery among narrow stops.

Practical choice: 07:30–08:55 is a reasonable common timing for the next C/E range-filter test. If drawdown is your dominant narrow-stop criterion, B's 07:05–08:55 deserves an equal final comparison; do not discard it just because it is 25 minutes earlier.

Controlled range-filter stage

Keep the no-range-filter C/E baselines. Before running more tests, write down a small grid of broad range/ATR bounds and its rationale. An illustrative grid is 0–0.8, 0–0.6 and 0.1–0.6 for each finalist: six new runs, with the same 08:55 cutoff and every other active setting frozen. These bounds are experiment candidates, not inferred winners from these exports. Confirm the EA's exact range/ATR denominator and sampling time first.

Judge the grid on return retained, drawdown and recovery, mean R, trade count, cost sensitivity and stability across years and neighboring bounds. Do not choose a range solely because it fixes one bad year. Recheck the preferred broad range on B before discarding the lower-DD timing challenger.

Then freeze the candidates and run the Python validation pipeline: input diff and data coverage, complete trade reconciliation, position/risk consistency, timing and timezone checks, costs, rolling/regime stability, block resampling and portfolio exposure. Save explicit pass/fail/inconclusive outcomes, with thresholds chosen before the next batch.

A historical extension into 2017–2019 is useful stress evidence, but that history has already been examined in earlier ORB work and is not pristine holdout data. Preserve a genuinely unseen forward period after settings are frozen before treating the strategy as validated.

Methods, scope and reading guide

The appendices retain every calendar month and week in the configured span

Net and profit factor. Net P&L; includes exported trade profit, commission and swap. Cash PF = sum of positive trade P&L; / absolute sum of negative trade P&L.; A dash denotes an undefined ratio, not zero. Budget-R PF applies the same ratio to normalized trade outcomes.

Calendar returns. Each month, week or year is measured from its opening closed balance to its closing balance. Trades are allocated by exit date; all exits here occur on entry date. Period returns compound within the period. Cash totals can be summed; percentage returns must be compounded. Appendix counts in parentheses are completed trades.

Risk and recovery. Balance risk is computed from the sequential closed-trade ledger. Headline relative equity drawdown is transcribed from the MT5 report because the exports do not contain the complete floating-equity path. Longest recovery means elapsed calendar days from peak to recovery. Local annual DD uses a reset annual peak.

Comparability. The same \$10,000 account and configured horizon are used throughout. Actual 1% risk sizing is rounded to available volume; average stop-distance risk is slightly below budget. The ledger supports actual trade outcomes, not the outcome of unexecuted signals or a causal decomposition of market behavior.

Limitations. ATR stop choices and timings were selected using this historical research process. Calendar, hourly, weekday and resampling statistics are descriptive and do not correct for that selection. No live fills, spread series, tester Journal, complete equity ticks or forward performance were supplied. Differences should be treated as research evidence, not guarantees.

Primary methodological references

MetaTrader 5 Help, Strategy Testing Results: [official report-statistic definitions](#). Source for distinguishing the report's balance/equity statistics; all numerical findings here come from the supplied files.

Bailey, Borwein, López de Prado and Zhu, The Probability of Backtest Overfitting: [primary research paper](#). Motivation for controlling repeated selection; a PBO estimate was not calculated in this report.

Appendix key

A: 0.25 / 06:05 · B: 0.25 / 07:05 · C: 0.25 / 07:30 · D: 0.65 / 06:05 · E: 0.65 / 07:30. All entries end before 08:55; broker time.

Monthly appendix: all 81 months, three pages. Weekly appendix: all 350 Monday-Sunday periods, ten pages. The first week begins 30 December 2019 but only test dates from 1 January 2020 are included. The final week is partial through 9 September 2026. Blank future dates are not fabricated.
