

Gold ORB: final six-run review

2020-01-01 to 2026-09-09 (end date exclusive) | Prepared 20 September 2026 for Abhishek

Move two candidates into the 2017-2026 extension: B as the aggressive but drawdown-conscious choice (0.25 ATR, 07:05, range 0.00-0.60) and F as the conservative choice (0.65 ATR, 07:30, range 0.00-0.60).

Choice	Net USD / CAGR	Equity DD	Why
B - aggressive	\$110,794 / 45.14%	16.73%	Near-unfiltered growth; modestly better consistency and risk measures.
F - conservative	\$21,869 / 18.92%	10.01%	Higher return, lower DD and shorter recovery than its unfiltered control.

The conservative/aggressive labels are relative to these ORB runs at the same 1% risk input. B still has meaningful tail risk. Its block-resampling 95th-percentile balance DD is about 30%; F is about 16%. These are model outputs, not future limits.

A material correction to the earlier screenshot conclusions

The new filtered exports do not match the earlier optimization screenshot profits. B now earns \$110,794.08, not \$68,939.97; D earns \$143,067.22, not \$86,742.66; F earns \$21,868.53, not \$18,452.19. The new deal ledgers reconcile to the new report headers. They are the evidence used in this report.

Consequently, the earlier claim that the 0.25 range filter sacrifices roughly 38% of profit no longer applies to this batch. B retains 98.4% of A's profit; D exceeds C's profit. B replaces the previous unfiltered aggressive preference by a narrow margin, not because its drawdown falls dramatically.

Six attached exports are reviewed, despite the request referring once to five systems. The unfiltered controls reproduce the previously reported totals. The discrepancy in filtered runs needs a saved-settings/tester-Journal comparison; it is not explained away as rounding.

Source integrity and actual settings

Independent reconstruction of Orders and Deals in every attached workbook

ID	Source filename
A	OBR_7-9_20-26_025ATR(1).xlsx
B	ORB_7-9_20-26_025ATR_0-60_RANGE.xlsx
C	ORB_730-9_20-26_025ATR(1).xlsx
D	ORB_730-9_20-26_025ATR_0-60_RANGE.xlsx
E	OBR_730-9_20-26_65ATR(1).xlsx
F	ORB_730-9_20-26_065ATR_0-60_RANGE.xlsx

Check	Finding
Market and period	XAUUSD; M15 header; 2020-01-01 to 2026-09-09; USD 10,000; leverage 1:100.
History	All six: 99% history quality, 158,082 bars and 282,827,485 ticks. These counts alone do not prove the modelling mode.
Active rules	M5 touch signal; ATR buffer 0.05; D1 ATR(14) stop; 1% balance risk; one trade/day; 03:05-06:05 range; 18:55 close.
Time and filters	Entry filter ON; start 07:05 or 07:30; end 08:55. ATR range filter differs as labelled. Percentage range and strong-candle filters OFF. Session_Clock=2, broker clock in the supplied enum.
Reconciliation	Every trade matched; no unmatched positions, overlapping positions, duplicate deal IDs or multiple entries/day. Every deal balance and report profit total reconciles to cents.
Risk and costs	Closed-balance DD agrees with reported rounding. Commission/swap are zero in these exports; embedded spread and execution effects remain possible.
Controlled differences	Only active entry-start minute, ATR range-filter enable and stop multiplier differ. Inactive saved range bounds vary in OFF runs.

All six currently share the same input structure and expert name. Comparing against older screenshot runs still requires their original full settings, model, journal and executable identity. No source-code change is inferred solely from a file name.

Correcting the drawdown comparison

Maximum monetary loss and maximum percentage loss can occur at different peaks

ID	Earlier screenshot net	New export net	New relative equity DD	New maximal equity DD field
B	68,939.97	110,794.08	16.73%	13 556.72 (15.41%)
D	86,742.66	143,067.22	20.11%	17 159.92 (14.87%)
F	18,452.19	21,868.53	10.01%	2 033.58 (6.93%)

For F, the new report has Equity Drawdown Maximal = \$2,033.58 (6.93%), but Equity Drawdown Relative = 10.01% (\$1,812.58). The first is the largest dollar decline and its associated percentage; the second is the largest percentage decline and its associated dollars. A smaller account peak can suffer the larger percentage decline.

Use 10.01%, not 6.93%, as F's maximum relative equity DD. Likewise use 16.73% for B and 20.11% for D. The older screenshot percentage matching one field in a new run does not establish identical runs or explain the changed profit.

Our earlier chat treated the screenshot DD column as directly comparable to the relative equity DD field. The full exports show why that was not a safe basis for final selection. This report consistently takes equity DD from the explicitly labelled Relative field and reconstructs balance DD separately.

Before the extension, save the six current .set files, EA executable/build identity and tester settings. Compare the earlier optimization setup if available. Possible explanations for different profits include modelling, execution settings, code or stale optimization results; none is confirmed by the exports alone.

Reference: MetaTrader 5 Testing Report definitions:

https://www.metatrader5.com/en/terminal/help/algotrading/testing_report . The numerical correction above is directly supported by the supplied workbook headers and ledgers.

Six-variant performance dashboard

All return and risk calculations use the same configured horizon

Metric	A	B	C	D	E	F
Trades	1,186	1,142	1,149	1,106	1,149	1,106
Net profit USD	112,575	110,794	139,059	143,067	19,546	21,869
Ending balance USD	122,575	120,794	149,059	153,067	29,546	31,869
CAGR %	45.45	45.14	49.77	50.37	17.58	18.92
Cash profit factor	1.424	1.445	1.430	1.464	1.352	1.415
Win rate %	39.46	40.11	40.03	40.78	52.31	52.89
Mean budget R	0.227	0.234	0.251	0.263	0.097	0.108
Total budget R	269.48	267.00	288.86	290.56	111.83	119.20
Budget-R PF	1.404	1.421	1.451	1.479	1.385	1.443
Balance DD %	15.75	15.72	18.66	18.66	9.77	9.14
Relative equity DD %	17.12	16.73	20.10	20.11	10.60	10.01
CAGR / equity DD	2.66	2.70	2.48	2.50	1.66	1.89
Daily Sharpe	1.65	1.69	1.78	1.84	1.61	1.77
Daily Sortino	4.01	4.08	4.38	4.54	2.88	3.21
Annualized volatility %	23.51	22.87	23.39	22.77	10.02	9.73

A/B: 0.25 at 07:05, OFF/ON. C/D: 0.25 at 07:30, OFF/ON. E/F: 0.65 at 07:30, OFF/ON. ON = range 0.00-0.60. All entries end before 08:55 broker time.

D leads return and daily Sharpe, but its 20.11% observed equity DD exceeds B's 16.73%. B has the stronger CAGR/equity-DD ratio. F improves E on return and drawdown, although it still has multi-month periods below its previous balance peak.

What the range filter really removes

Matched trade dates identify the difference without confusing it with timing changes

Pair	Profit retained	Equity DD: OFF / ON	Removed trades	Removed total R
A -> B	98.42%	17.12 / 16.73	44	1.158
C -> D	102.88%	20.10 / 20.11	43	-0.663
E -> F	111.88%	10.60 / 10.01	43	-6.256

Every common trade in each OFF/ON pair has the same entry timestamp and direction. Later account balances and volume rounding can still change net cash and budget R slightly. The range filter removes 44 days for A/B and 43 for C/D and E/F. It does not replace those days with later entries in these exports.

The removed A trades contribute only +1.158 budget R in total. Removed C trades contribute -0.663 R. Removed E trades contribute -6.256 R. The wider stop therefore has the clearer evidence that the rejected opportunities were weak in normalized terms.

Year	Removed R: A	Removed R: C	Removed R: E
2020	2.834	2.582	-0.745
2021	-1.952	-1.970	-0.575
2022	-2.013	-1.991	-1.979
2023	-0.995	-0.994	-0.939
2024	1.423	2.458	0.150
2025	0.667	-1.301	-0.072
2026	1.194	0.553	-2.095

Budget R = trade net P&L; / 1% of its recorded pre-entry balance. The removed-trade analysis is descriptive, not a causal experiment or a compounded counterfactual. Profit retention can exceed 100% when filtered net profit is higher.

Calendar years and regime dependence

Annual percentage returns; 2026 is partial through the configured end

Year	A	B	C	D	E	F
2020	26.88	22.52	39.65	36.73	11.39	12.48
2021	78.84	82.78	90.40	94.44	45.18	46.18
2022	46.53	49.72	54.26	57.47	10.82	13.13
2023	9.65	10.56	19.29	20.70	6.42	7.88
2024	42.54	40.87	42.07	39.28	23.08	22.99
2025	60.31	59.61	54.22	57.20	17.57	16.67
2026*	47.13	44.92	39.04	38.35	7.06	10.67

Annual cash profit factor

Year	A	B	C	D	E	F
2020	1.247	1.224	1.390	1.392	1.281	1.335
2021	1.514	1.538	1.570	1.597	1.903	1.950
2022	1.326	1.349	1.382	1.407	1.184	1.226
2023	1.090	1.099	1.190	1.204	1.142	1.176
2024	1.336	1.338	1.351	1.344	1.487	1.519
2025	1.459	1.521	1.434	1.524	1.346	1.397
2026	1.749	1.780	1.631	1.675	1.267	1.482

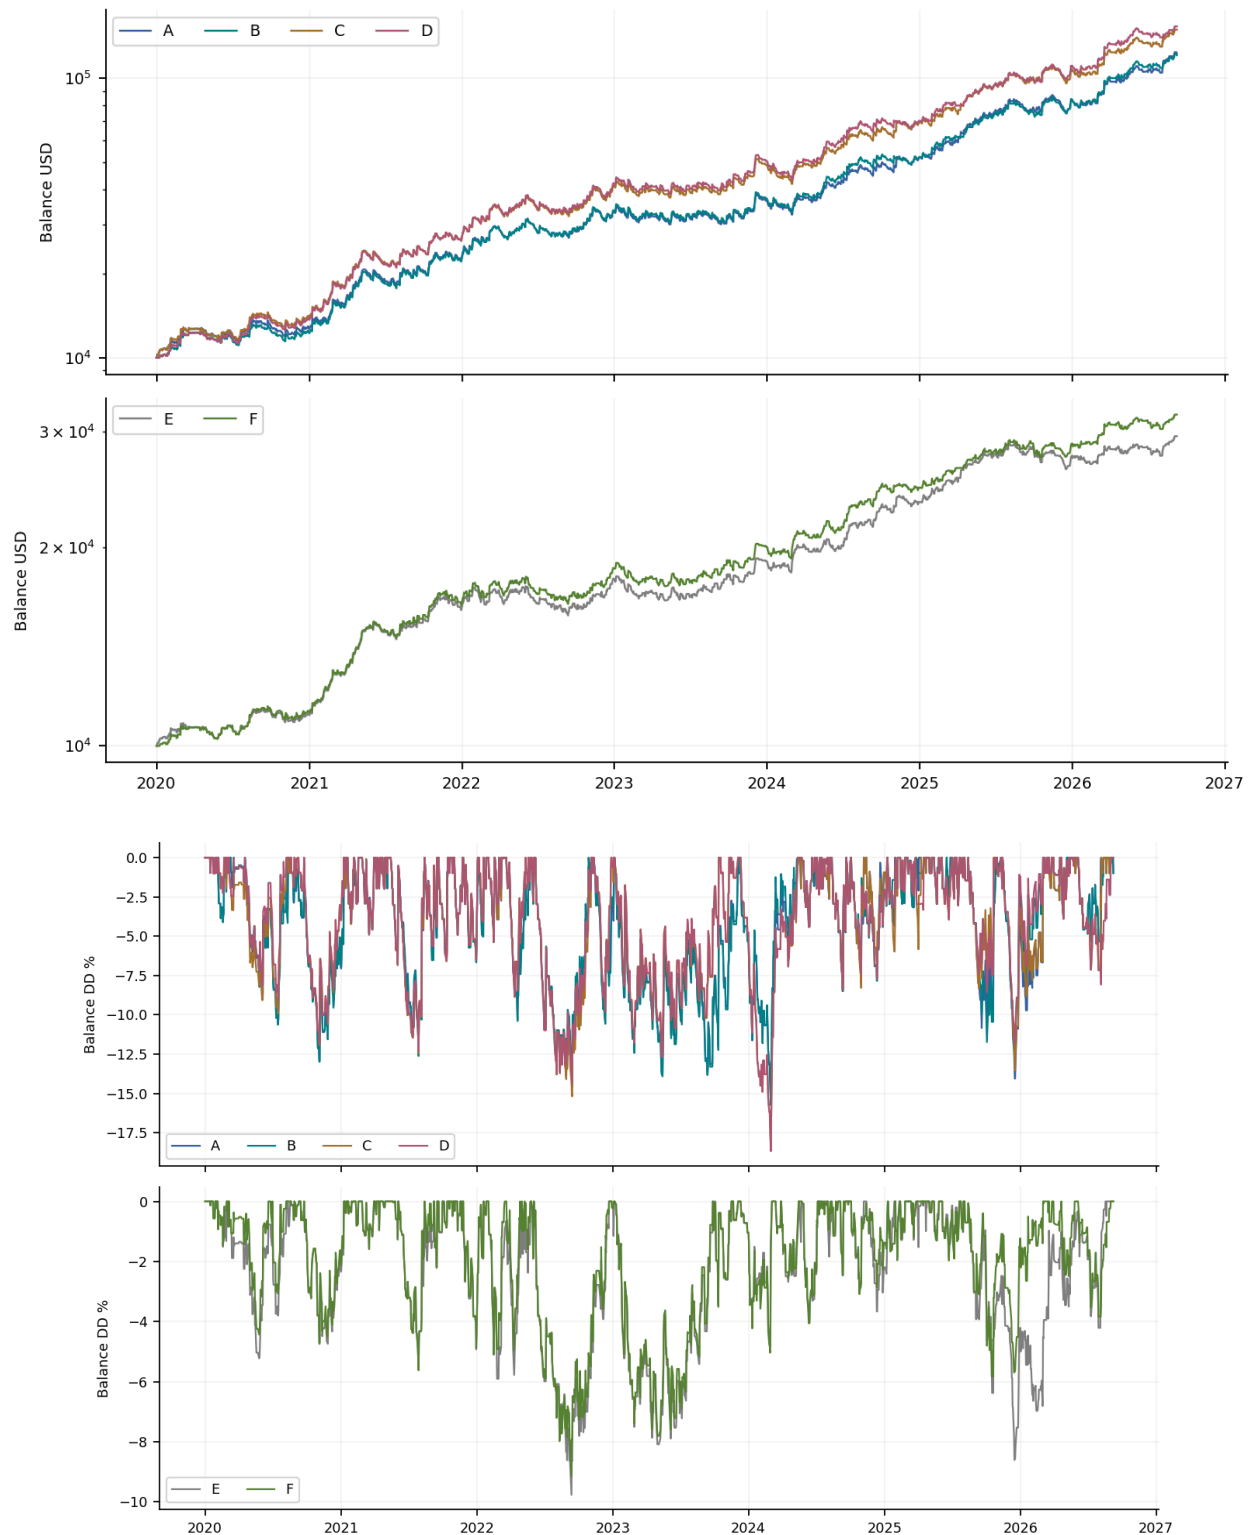

All six are positive in each displayed year. D's and C's full-period return advantage over the 07:05 choices is strongest in the early years; B beats D in 2024, 2025 and 2026. This supports preserving 07:05 for the drawdown-conscious aggressive choice rather than choosing the largest terminal balance.

F improves E in 2020-2023 and 2026, with small reductions in 2024-2025. The conservative filter benefit is not confined to fixing one negative calendar year. Nonetheless, these years have already influenced parameter selection and are not untouched validation.

A/B: 0.25 at 07:05, OFF/ON. C/D: 0.25 at 07:30, OFF/ON. E/F: 0.65 at 07:30, OFF/ON. ON = range 0.00-0.60. All entries end before 08:55 broker time. Returns compound within each calendar period; annual percentages should not be added.

Balance and drawdown paths

Closed-balance curves; floating equity is available only as report summary statistics

A/B: 0.25 at 07:05, OFF/ON. C/D: 0.25 at 07:30, OFF/ON. E/F: 0.65 at 07:30, OFF/ON. ON = range 0.00-0.60. All entries end before 08:55 broker time. Balance chart uses log scale. DD curves use end-of-day closed balances; all current positions close within the entry date. Intratrade equity paths are not reconstructed from these exports.

Consistency, recovery and concentration

Lower maximum drawdown does not guarantee a shorter recovery

Metric	A	B	C	D	E	F
Positive months / 81	51	53	53	55	48	52
Positive weeks / 350	185	185	187	184	200	201
Longest recovery days	333	333	281	281	379	265
Worst rolling 12m %	-7.34	-6.65	2.55	4.76	-4.15	-1.99
Positive rolling 12m %	99.06	99.40	100.00	100.00	93.64	98.46

Metric	A	B	C	D	E	F
Longest losing streak	17	15	16	14	9	7
Mean holding hours	8.07	8.16	7.95	8.04	10.52	10.57
Worst trade return %	-1.25	-1.24	-1.24	-1.24	-1.00	-1.00
Mean planned SL risk %	0.986	0.985	0.988	0.988	0.934	0.937
Top 1 winner / net %	5.83	5.92	6.08	6.12	4.48	4.00
Top 5 winners / net %	26.33	24.96	27.03	25.64	19.07	17.40
Top 10 winners / net %	42.93	40.32	44.18	41.12	32.50	29.71
Mean R excluding top 10	0.159	0.164	0.181	0.191	0.071	0.081
Daily loss VaR 95%	1.000	1.000	1.000	1.000	0.951	0.946
Daily expected shortfall 95%	1.013	1.012	1.012	1.011	0.977	0.973

B improves positive-month count (53 versus 51), reduces the longest losing streak (15 versus 17) and slightly improves the worst rolling year versus A. Its 333-day longest recovery is unchanged. This is a modest consistency improvement, not a transformation of the drawdown path.

F shortens the longest recovery from 379 to 265 days, lowers the longest losing streak from 9 to 7 and improves the worst rolling year from -4.15% to -1.99%. This broader improvement strengthens its selection over E.

Trade payoffs and rolling ranges

Cash averages reflect changing account size; budget R normalizes by planned account risk

Metric	A	B	C	D	E	F
Gross profit USD	377,899	359,975	462,559	451,460	75,068	74,560
Gross loss USD	265,324	249,181	323,500	308,393	55,522	52,692
Winning trades	468	458	460	451	601	585
Losing trades	718	684	689	655	548	521
Breakeven trades	0	0	0	0	0	0
Average winner USD	807.48	785.97	1,005.56	1,001.02	124.90	127.45
Average loser USD	-369.53	-364.30	-469.52	-470.83	-101.32	-101.14
Best trade return %	10.91	10.91	10.85	10.90	3.93	4.05
Longest winning streak	8	8	7	8	9	9

Expected payoff USD	A	B	C	D	E	F
Net profit / trades	94.92	97.02	121.03	129.36	17.01	19.77

Rolling window: best %	A	B	C	D	E	F
3 months	52.70	52.85	53.89	53.99	23.07	22.94
6 months	70.42	73.09	84.65	86.76	39.87	39.12
12 months	98.75	100.45	112.34	116.98	55.04	56.02

Rolling window: positive %	A	B	C	D	E	F
3 months	78.83	79.55	81.33	82.05	73.72	79.67
6 months	91.72	92.65	95.55	95.92	84.19	89.81
12 months	99.06	99.40	100.00	100.00	93.64	98.46

The narrow-stop candidates win less often but earn larger winners relative to losses. The wide-stop candidates win more often and hold more trades to the daily close. Neither win rate nor expected cash payoff alone is a sufficient selection criterion.

No breakeven trades or overnight holdings occur in this batch. Cash averages should not be compared as though every trade used the same starting balance. Rolling windows overlap and share observations.

Costs and resampling stress

Stress calculations are diagnostic and do not establish future limits

ID	Net after \$27/lot	Adjusted PF	Adjusted mean R
A	98,784.60	1.361	0.192
B	97,443.12	1.379	0.198
C	122,437.42	1.367	0.216
D	126,710.89	1.398	0.227
E	16,921.02	1.298	0.084
F	19,238.46	1.356	0.095

Hypothetical extra round-trip charge: \$27 times filled lots, subtracted from each trade. Original volumes and R denominators are held fixed. This is not a compounded rerun or a quote of broker costs. All recorded commissions/swaps are zero.

ID	Median DD	95th DD	99th DD	5th CAGR
A	19.88%	31.23%	36.86%	27.16%
B	19.40%	30.15%	36.82%	26.75%
C	19.38%	30.65%	35.73%	30.37%
D	18.82%	29.17%	35.09%	30.96%
E	10.78%	17.57%	21.10%	10.09%
F	9.80%	15.89%	18.78%	11.58%

B's 16.73% observed equity DD must not be treated as a safe future bound. The 20-day-block model yields a 95th-percentile balance DD of 30.15%; F yields 15.89%. Floating-equity risk can be larger than balance risk. D actually has a lower resampled 95th DD than B despite a worse observed equity DD, so B is not unambiguously safer under every risk model.

2,000 circular moving-block resamples for each of 5 and 20 weekdays, seed 19092026. Table uses 20-day blocks. Aligned weekday returns, including no-trade days, are resampled and compounded over the same horizon. Regime shifts, parameter-selection bias and new execution costs are not modelled. Percentiles are conditional on this resampling design.

Daily correlation and directional exposure

The two selected candidates remain related Gold breakout exposures

ID	A	B	C	D	E	F
A	1.000	0.973	0.974	0.948	0.837	0.818
B	0.973	1.000	0.948	0.974	0.810	0.840
C	0.974	0.948	1.000	0.974	0.849	0.831
D	0.948	0.974	0.974	1.000	0.822	0.853
E	0.837	0.810	0.849	0.822	1.000	0.966
F	0.818	0.840	0.831	0.853	0.966	1.000

ID	Buy PF / mean R	Sell PF / mean R	SL / daily close
A	1.413 / 0.197	1.436 / 0.260	658 / 528
B	1.404 / 0.197	1.488 / 0.274	624 / 518
C	1.410 / 0.216	1.450 / 0.291	629 / 520
D	1.421 / 0.221	1.508 / 0.308	595 / 511
E	1.421 / 0.105	1.284 / 0.088	192 / 957
F	1.481 / 0.113	1.351 / 0.102	170 / 936

B and F correlate at 0.840. They are aggressive/conservative alternatives, not independent systems. If eventually traded together, do not assume that two separate 1% risk settings create a conservative combined account. A joint sizing and equity test is required.

Correlations use aligned weekday closed-balance returns. Shared no-trade days and common market exposure remain part of the sample. No portfolio allocation or combined drawdown has been simulated.

A: 0.25 / 07:05 / OFF

Individual variant review; ON means range 0.00-0.60

2020	11.5	11.7	1.9	-4.1	-2.3	1.0	3.7	8.3	-4.0	-7.4	3.2	2.4

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

Year	Trades	Net USD	Return %	PF	Mean R	Local DD %
2020	156	2,688.18	26.88	1.247	0.167	12.93
2021	176	10,003.26	78.84	1.514	0.350	12.52
2022	192	10,558.99	46.53	1.326	0.215	14.58
2023	174	3,210.05	9.65	1.090	0.070	13.76
2024	188	15,508.98	42.54	1.336	0.204	11.64
2025	184	31,342.06	60.31	1.459	0.271	14.05
2026	116	39,263.60	47.13	1.749	0.347	5.71

Peak	Trough	Recovery	Days	Depth %
2023-01-05	2023-05-15	2023-12-04	333	13.76
2023-12-06	2024-03-01	2024-05-13	159	15.75
2022-06-07	2022-09-14	2022-11-04	150	14.58

Good unfiltered control. It retains slightly more profit than B but has marginally weaker PF, Sharpe, monthly consistency and loss streak. Preserve as the fallback if B's modest benefit fails the extension.

Heatmap cells are monthly returns (%), colors capped at +/-15%; dashes are outside the horizon. 2026 is partial. Local annual DD resets the peak at year opening. Episode tables show the three longest balance recoveries, not necessarily the three deepest.

B: 0.25 / 07:05 / ON

Individual variant review; ON means range 0.00-0.60

2022-06-07	2022-09-14	2022-10-28	143	13.70

Selected aggressive candidate for the user's drawdown-conscious objective. The range cap retains 98.4% of A's profit, with modest improvements across several diagnostics. Recovery remains long, and the advantage is small enough to require careful extension testing.

Heatmap cells are monthly returns (%), colors capped at +/-15%; dashes are outside the horizon. 2026 is partial. Local annual DD resets the peak at year opening. Episode tables show the three longest balance recoveries, not necessarily the three deepest.

C: 0.25 / 07:30 / OFF

Individual variant review; ON means range 0.00-0.60

2020-03-05	2020-07-15	2020-08-07	155	9.92

Strong growth baseline, but higher observed DD than B. The new filtered D modestly improves return and consistency at virtually the same drawdown. C is therefore not the preferred 07:30 version in this batch.

Heatmap cells are monthly returns (%), colors capped at +/-15%; dashes are outside the horizon. 2026 is partial. Local annual DD resets the peak at year opening. Episode tables show the three longest balance recoveries, not necessarily the three deepest.

2022-06-07	2022-09-14	2022-11-04	150	14.33

Highest growth and Sharpe; a credible more aggressive alternative. Its 20.11% equity DD and lower CAGR/equity-DD ratio than B make it less aligned with the stated drawdown preference. Do not claim that it is inferior under equal-risk sizing; that experiment has not been run.

Heatmap cells are monthly returns (%), colors capped at +/-15%; dashes are outside the horizon. 2026 is partial. Local annual DD resets the peak at year opening. Episode tables show the three longest balance recoveries, not necessarily the three deepest.

E: 0.65 / 07:30 / OFF

2022-06-03	2022-09-12	2022-12-22	202	9.14

Selected conservative candidate. The filter improves mean R and return while reducing drawdown and stagnation. It remains exposed to Gold ORB regimes and may experience materially worse future DD than the 10.01% observed figure.

Heatmap cells are monthly returns (%), colors capped at +/-15%; dashes are outside the horizon. 2026 is partial. Local annual DD resets the peak at year opening. Episode tables show the three longest balance recoveries, not necessarily the three deepest.

Entry-hour and weekday diagnostics

Trade profit is attributed to the entry hour/day, even when it exits later

ID	07:00 trades / net USD / mean R	08:00 trades / net USD / mean R
A	875 / 73,092.32 / 0.194	311 / 39,482.80 / 0.321

D	763 / 92,266.10 / 0.259	343 / 50,801.12 / 0.271
E	794 / 11,490.49 / 0.087	355 / 8,055.47 / 0.121
F	763 / 13,000.93 / 0.098	343 / 8,867.60 / 0.130

Weekday mean R	A	B	C	D	E	F
Monday	0.081	0.102	0.091	0.125	0.017	0.036
Tuesday	0.284	0.316	0.322	0.363	0.140	0.165
Wednesday	0.057	-0.014	0.041	-0.030	0.043	0.023
Thursday	0.345	0.381	0.417	0.451	0.135	0.161
Friday	0.362	0.373	0.376	0.392	0.149	0.150

Rolling window: worst %	A	B	C	D	E	F
3 months	-15.08	-15.05	-18.01	-18.01	-8.61	-7.84
6 months	-10.76	-10.39	-9.36	-9.29	-8.66	-7.54
12 months	-7.34	-6.65	2.55	4.76	-4.15	-1.99

All other entry hours have zero entries. Hour 07 starts at 07:05 for A/B and 07:30 for C-F; hour 08 ends before 08:55. These conditional cohorts do not justify another fine-grained timing or weekday optimization. The parameter search is now finished for the selected extension candidates.

Rolling windows use 63/126/252 weekdays, overlap and are not independent observations. Daily cash and budget-R averages carry different weighting because account size changes.

Final selection and 2017-2026 extension

Freeze B and F; use the longer history to challenge the decisions

Input	B: aggressive	F: conservative
Stop multiplier	0.25 D1 ATR	0.65 D1 ATR
Entry window	07:05-08:55	07:30-08:55
ATR range filter	ON, 0.00-0.60	ON, 0.00-0.60
Risk input for matched research	1% balance	1% balance
Observed equity DD	16.73%	10.01%
Longest balance recovery	333 days	265 days

Why B rather than D? B gives up growth (45.14% versus 50.37% CAGR) for a lower observed equity DD (16.73% versus 20.11%) and the stronger CAGR/equity-DD ratio (2.70 versus 2.50). That aligns with the user's preference. D remains the archived growth benchmark, not an invitation to keep optimizing.

Why F rather than E? F improves both sides of the comparison: 11.9% more net profit, lower relative equity DD, higher mean R and shorter recovery. Its rejected trades have negative aggregate R across most years. This is the stronger filter decision.

Run both unchanged from 2017-01-01 to the same 2026 endpoint, then inspect 2017-2019 separately and the full span. Confirm history coverage: the earlier long-history reports began trading in April 2017 and reported 96% quality. Do not silently treat an initial no-trade interval as complete market evidence.

Because 2017-2019 has already been viewed in earlier ORB research, it is a historical extension/stress test, not pristine out-of-sample validation. Preserve a genuinely unseen forward period after freezing parameters. If a candidate fails, investigate the failure before reopening the grid.

The risk input is retained for comparability, not a live-sizing recommendation. If the stress drawdown is too large for the intended account, rerun at lower risk and evaluate the joint exposure before deployment.

Methods and limits

Every calendar month and week follows in the appendices

Net profit includes exported profit, commission and swap. Profit factor is gross positive P&L; divided by absolute gross negative P&L.; Budget R divides trade net P&L; by 1% of pre-entry balance. Example: on \$10,000, a \$200 winner is +2 budget R. Actual stop risk differs slightly through volume rounding.

CAGR uses the 2,443-day configured span with ACT/365.25. Daily statistics use Monday-Friday closed-balance returns including zero-return days; Sharpe and Sortino use zero benchmark and 252-day annualization. VaR and expected shortfall describe the historical daily-loss tail, not the worst possible loss.

Calendar P&L; is grouped by exit date; all trades close on entry date here. Monthly/weekly returns measure closing balance divided by opening balance minus one. Counts and cash profits sum; returns compound. The first week begins 2019-12-30 but includes only dates from 2020-01-01. The final week includes dates before 2026-09-09 only.

Equity DD comes from the explicitly labelled relative field. Balance DD is independently reconstructed. Complete intratrade floating equity and execution logs are absent. A matching expert name and tick count do not prove identical compiled code or modelling settings across older runs.

The resampling and descriptive ratios do not adjust for the many settings already considered. B's modest lead over A is not established statistical superiority. This report supports the next research stage, not a declaration of live readiness.
