

Gold ORB: the longer-history verdict

Four final exports, 2017-2026 | Missed-trade analysis and combined-account simulation | 20 September 2026

Your concern is correct: the filters discard valuable early-period opportunities. The 2017-2019 extension materially weakens the earlier case for filtered 0.25 at 1% risk. Filtered 0.65 remains the more defensible conservative candidate, with a meaningful opportunity cost.

Variant	Full CAGR	Relative equity DD	Longest balance recovery
U25	38.35%	33.56%	552 days
F25	30.02%	28.08%	654 days
U65	15.21%	12.93%	425 days
F65	12.77%	10.32%	503 days

Filtered 0.25 earns only +4.18% cumulatively in 2017-2019 versus +82.55% unfiltered. Filtered 0.65 earns +1.32% versus +23.15%. The narrow-stop filtered account loses 17.83% in 2019 and takes 654 days to regain its March 2019 balance peak. That is not a small-loss regime at the tested sizing.

Your combined 0.25 idea: a shared-account simulation at 1% F25 plus 0.3% U25 grows \$10,000 to about \$308,444, with 42.47% CAGR and 33.47% closed-balance DD. It improves growth and recovery relative to F25, but increases drawdown. It is not the lower-drawdown solution at those weights.

U25/U65: no entry window and no range filter. F25: 07:05-08:55, range 0.00-0.60. F65: 07:30-08:55, range 0.00-0.60. All times broker clock. MIX: simulated shared account, F25 at 1% plus U25 at 0.3%.

The report uses all four attached trade ledgers. Portfolio figures are normalized-return simulations, not a native MT5 portfolio backtest or reconstructed floating-equity curve. The final sections explain assumptions, equal-risk controls and the recommended next decision.

Data integrity, settings and coverage

The unfiltered controls disable both filters, as requested

ID	File
U25	ORB_2017-2026_025(1).xlsx
F25	7-9_WITHRANGE_25ATR.xlsx
U65	ORB_2017-2026_065(1).xlsx
F65	730-9_WITHRANGE_65ATR.xlsx

Check	Finding
Configured test	2017-01-01 to 2026-09-09, end exclusive; USD 10,000; 1% balance risk; XAUUSD; D1 ATR(14) stop reference.
Shared mechanics	03:05-06:05 range; 18:55 close; M5 touch entries; one trade/day; stop 0.25 or 0.65. Range filter ON only for F25/F65.
Ledger integrity	All entry/exit pairs, deal balances, net/gross profits and balance-DD figures reconcile. No overlapping positions within each standalone run; all close the same day.
History gap	All four report 96% history quality. U25/U65 first enter 7 April 2017; F25/F65 first enter 10 April 2017. January-March coverage remains unverified.
EA version	Unfiltered exports are ORB_V2; filtered exports are ORB_V3_CUTOFF. Active shared settings align, but executable/source equivalence beyond the filters is not proven.
Costs	Every exported commission and swap is zero. Spread/execution effects may be embedded in filled prices.
Comparison limit	Changing both filters and EA version prevents clean causal isolation of time versus range. Recorded entry times still establish which historical opportunities the window makes ineligible.

The 2020-2026 overlaps of F25/F65 reproduce the earlier short-span entry timestamps, sides, entry prices, exit timestamps and exit prices exactly: 1,142 and 1,106 trades respectively. Cash profits differ because starting the account in 2017 changes balance-dependent volumes.

Average absolute budget-R differences in those overlaps are approximately 0.0133 R for F25 and 0.0081 R for F65. Identical price paths plus different account sizes make lot rounding a plausible contributor; these are not new signals. No missing early trades were invented.

Standalone performance dashboard

Four candidates measured with the same definitions and time span

Metric	U25	F25	U65	F65
Completed trades	2,391	1,521	2,391	1,462
Net profit USD	222,001.55	117,166.84	29,409.28	22,030.29
Ending balance USD	232,001.55	127,166.84	39,409.28	32,030.29
CAGR %	38.35	30.02	15.21	12.77
Cash PF	1.312	1.407	1.244	1.350
Win rate %	39.10	38.99	51.23	51.57
Mean budget R / trade	0.145	0.182	0.060	0.082
Total budget R	347.16	276.74	143.69	120.58
Budget-R PF	1.257	1.322	1.236	1.330
Maximum balance DD %	33.05	27.16	12.21	9.65
Relative equity DD %	33.56	28.08	12.93	10.32
CAGR / equity DD	1.143	1.069	1.176	1.237
Daily Sharpe	1.345	1.293	1.255	1.319
Daily Sortino	3.017	3.021	2.115	2.314
Annualized volatility %	25.75	21.34	11.42	9.11

F25 has a better cash PF and mean R than U25, yet lower CAGR, a slightly worse CAGR/equity-DD ratio and longer recovery. More selective trades are not automatically a better account outcome. F65 lowers volatility and improves Sharpe modestly relative to U65, while giving up growth.

CAGR uses the full configured 3,538-day horizon, including the unverified initial interval. Daily metrics use weekday closed-balance returns, zero benchmark and 252-day annualization. Equity DD is the explicitly labelled Relative field, not the percentage alongside the largest dollar drawdown.

Where the performance changes

Cumulative segment returns, not annualized returns

Period	U25	F25	U65	F65
2017-2019	82.55%	4.18%	23.15%	1.32%
2020	40.73%	23.19%	19.83%	11.90%
2020-2026	1,170.91%	1,120.60%	220.00%	216.13%
2021-2026	803.06%	890.84%	167.05%	182.52%
2023	-16.68%	10.75%	-1.65%	7.68%
2024-2026	356.58%	226.46%	86.85%	58.77%

2017-2019	U25	F25	U65	F65
Trades	694	379	694	356
Total budget R	68.63	8.63	22.53	2.19
Local balance DD %	25.48	27.16	11.67	9.65

The largest loss of opportunity comes before 2020. After 2020, filtered returns are much closer to their unfiltered counterparts when measured from each segment's own starting balance. This is why early underperformance has such a large effect on terminal cash: the filtered account enters the strong later years with less capital.

2020 is also weaker under the filters. From 2021 onward, filtered cumulative returns exceed unfiltered returns for each stop size, but that comparison excludes an unfavourable earlier period. It is useful for diagnosing regime dependence, not for redefining the backtest start to make the strategy look better.

2023 provides the opposite case: U25 loses 16.68% while F25 gains 10.75%; U65 loses 1.65% while F65 gains 7.68%. The filters help in some regimes and hurt in others. We have not identified a reliable rule that predicts which regime comes next.

The early history visually

2017-2019 balance paths reveal the lost growth and the 2019 decline

The early filtered curves are not steadily flat. F25 rises in 2018 and early 2019, then gives back much of that gain. F65 shows a shallower version of the same cycle. Terminal near-breakeven returns alone conceal meaningful interim drawdowns.

Charts begin at the configured start, but the initial no-trade interval is not proof of complete market coverage. The same USD 10,000 starting account is used for all four.

Which opportunities are missed?

Pair each filtered trade day with the corresponding unfiltered day

Pair	Omitted days	Common days	Changed entry time	Changed side
U25 / F25	870	1,521	793	25
U65 / F65	929	1,462	898	39

Every filtered trade day is a subset of its unfiltered counterpart's trade days. However, many surviving days enter later or in the opposite direction. The performance difference is therefore not just the sum of deleted trade rows.

2017-2019 attribution	0.25 pair	0.65 pair
Unfiltered days omitted	315	338
R earned by omitted trades	+51.73	+16.46
Filtered minus unfiltered R on common days	-8.26	-3.88
Total filtered minus unfiltered R	-60.00	-20.34

For 0.25, about 51.73 R of the 60.00 R early shortfall comes from omitting profitable days. Another 8.26 R is lost through changed outcomes on common days. For 0.65, those components are 16.46 R and 3.88 R. Most of the early shortfall is therefore associated with missed opportunities, not just slightly different fills.

R uses each run's own 1% pre-entry balance budget. Attribution includes small sizing/rounding differences and possible EA-version effects. Cash cannot be decomposed the same way because capital paths compound differently.

The cutoff explains much of the early gap

Categorize omitted unfiltered trades by their original entry time

Pair / period	Entry-time bucket	Trades	Total R	Mean R
U25 / 2017-2019	after cutoff	283	57.11	0.202
U25 / 2017-2019	before start	29	-6.13	-0.211
U25 / 2017-2019	inside window	3	0.75	0.250
U25 / 2020-2026	after cutoff	426	7.77	0.018
U25 / 2020-2026	before start	107	-39.14	-0.366
U25 / 2020-2026	inside window	22	5.53	0.252
U65 / 2017-2019	after cutoff	283	16.44	0.058
U65 / 2017-2019	before start	54	-0.62	-0.011
U65 / 2017-2019	inside window	1	0.63	0.635
U65 / 2020-2026	after cutoff	426	4.72	0.011
U65 / 2020-2026	before start	146	-23.29	-0.160
U65 / 2020-2026	inside window	19	-1.28	-0.067

In 2017-2019, 283 omitted trades entered at or after 08:55 in each unfiltered system. They contributed +57.11 R for U25 and +16.44 R for U65. These entries cannot occur under the frozen cutoff. In the later period, omitted late trades contribute only +7.77 R and +4.72 R despite the larger sample.

Omitted pre-start trades were negative in aggregate, particularly in 2020-2026. Delaying entry can help avoid those opportunities, while an early cutoff can also remove valuable later opportunities. The two effects should not be assumed to have the same benefit.

A time bucket is an observed classification, not proof that only that condition blocked the trade. Some late days may also fail the range filter. Omitted entries originally inside the permitted window need range/EA-log review; we cannot assign their cause uniquely from the ledger.

Calendar-year returns

2017 begins trading in April; 2026 is partial

Year	U25	F25	U65	F65
2017	30.98%	3.06%	10.00%	-0.78%
2018	60.56%	23.02%	19.73%	6.89%
2019	-13.20%	-17.83%	-6.49%	-4.46%
2020	40.73%	23.19%	19.83%	11.90%
2021	49.46%	82.91%	34.27%	46.34%
2022	58.83%	49.84%	8.23%	12.92%
2023	-16.68%	10.75%	-1.65%	7.68%
2024	66.36%	41.11%	37.10%	23.43%
2025	63.66%	60.04%	15.26%	16.14%
2026	67.69%	44.55%	18.24%	10.76%

No system needs to profit every calendar year. But there is a major difference between a shallow, bounded weak period and a long capital decline. F25's 2019 loss of 17.83% is worse than U25's 13.20% loss, despite F25 taking fewer trades. F65's 4.46% loss is smaller than U65's 6.49% loss.

Filtered narrow-stop returns improve substantially in 2021-2023. Strong 2024-2026 performance exists in both versions. The longer sample is therefore a regime trade-off, not evidence that the entire filtered strategy has no edge.

Do not add annual percentages to calculate full return. Results compound. The 2017 and 2026 rows are not comparable to full years in duration.

Long-term account paths

Unfiltered early gains compound into a larger later account

The large dollar gap in the 0.25 curves should be read alongside segment returns and R attribution. Much of it is accumulated capital from early years, not necessarily a proportionate difference in the quality of every later trade.

Drawdown, recovery and trade behaviour

The full-history risk picture supersedes the 2020-only impression

Metric	U25	F25	U65	F65
Mean winner USD	999.31	682.71	122.42	112.64
Mean loser USD	-489.59	-310.00	-103.48	-88.84
Longest loss streak	17	15	12	9
Mean holding hours	7.75	8.10	10.29	10.55
Worst trade return %	-1.20	-1.25	-1.02	-1.02
Top 1 winner / net %	5.23	5.97	3.47	3.97
Top 5 winners / net %	23.97	24.90	15.03	17.27
Top 10 winners / net %	39.77	40.16	26.34	29.64
Mean R without top 10	0.111	0.129	0.047	0.062
Daily VaR 95% loss	1.003	1.000	0.976	0.947
Daily expected shortfall	1.019	1.014	0.989	0.976

U25: longest recovery 552 days, 2023-01-06 to 2024-07-11; trough 2024-03-01; episode balance DD 33.05%.

F25: longest recovery 654 days, 2019-03-26 to 2021-01-08; trough 2019-12-20; episode balance DD 27.16%.

U65: longest recovery 425 days, 2023-01-06 to 2024-03-06; trough 2023-09-13; episode balance DD 11.88%.

F65: longest recovery 503 days, 2019-03-27 to 2020-08-11; trough 2019-12-20; episode balance DD 9.65%.

Maximum full-period equity DD and a longest balance-recovery episode are different metrics. F25's 28.08% equity DD is not the 15.40% printed beside its maximum monetary equity drawdown. The largest percentage drop occurs earlier on a smaller account.

Consistency and stress tests

Positive expectancy can coexist with substantial losing periods

Metric	U25	F25	U65	F65
Positive active months	65 / 114	65 / 114	62 / 114	70 / 114
Worst rolling 3m %	-22.85	-15.04	-9.63	-7.90
Worst rolling 6m %	-18.36	-17.24	-9.74	-7.80
Worst rolling 12m %	-24.77	-20.53	-6.69	-5.76
20d-block 95th balance DD %	41.37	35.01	23.87	19.08
20d-block 5th CAGR %	22.04	16.76	8.50	7.07

ID	Net after \$27/lot	Cash PF	Mean budget R
U25	178,615.25	1.242	0.095
F25	99,496.69	1.333	0.134
U65	22,088.23	1.178	0.042
F65	18,226.53	1.281	0.065

All four retain positive arithmetic net profit under the hypothetical extra cost stress, but this does not establish executable broker performance. Wider-stop mean R is lower and remains sensitive to costs. Review actual commissions and spread rather than assuming zero exported commission means trading is free.

Rolling windows use 63/126/252 weekdays. Resampling: 2,000 circular 20-weekday-block draws over the full horizon, preserving short-run dependence and zero-return days; standalone seed 19092026. Missing-history zeros are included and may dilute daily risk estimates. No selection-bias or structural regime correction. Cost stress subtracts \$27 per filled round-trip lot, with original volumes fixed; not a compounded rerun.

Can a system be acceptable while flat?

Yes, but the path, opportunity cost and evidence of recovery matter

F65 is the more credible example of tolerable underperformance. It ends 2017-2019 up only 1.32%, but local balance DD is 9.65%, and its worst calendar year is -4.46%. Over the full period it earns 12.77% CAGR with 10.32% relative equity DD. That can remain a conservative research candidate if the eventual risk budget can tolerate prolonged recovery and worse future outcomes.

F25 is not a convincing capital-preservation example at 1% risk. Its early cumulative gain is only 4.18%, but it experiences 27.16% balance DD, 28.08% full-period equity DD and a 654-day recovery. Calling that simply flat or not losing much would understate the burden.

A weak period can be acceptable when: the loss and recovery stay within a predeclared tolerance; positive expectancy survives costs and reasonable stress; the result is not carried by a few trades; and the strategy contributes something useful to the wider portfolio. A later historical recovery alone does not guarantee the next one.

The present data show positive full-period expectancy for all four. They do not prove a stable future edge. In particular, the early late-session profits indicate that the selected window is regime-dependent. Do not retroactively switch filters off only in 2017-2019; that would require knowing the regime in advance.

For the stated objective of avoiding large drawdown, retain F65 as the conservative candidate. Treat every 0.25 version, including the combined allocation, as an aggressive research candidate whose sizing must be reconsidered. The 2020-2026-only recommendation understated the risk exposed by the longer history.

U25 individual calendar review

Complete monthly heatmap and exact annual statistics

Year	Trades	Net USD	Return %	Cash PF	Mean R
2017	183	3,098.45	30.98	1.275	0.158

Calendar appendix reading guide

Full monthly and weekly results for the four systems and the requested combined account

Every cell in the following tables shows period return (%) and completed position count in parentheses. MIX is the simulated shared account described in the final sections. Its count includes both strategy positions, even when they share an entry time; it is not a count of independent signals.

Calendar return = closing balance / opening balance - 1. Period returns compound. Trade P&L; is allocated to exit date; all positions close on entry date. The first weekday-based week starts 2017-01-02; the configured start was Sunday 2017-01-01. January-March 2017 have no trades and unverified coverage. The final week and September 2026 are partial.

Portfolio results appear here for side-by-side calendar comparison; the final sections explain their construction, risks and limitations. They are modelled closed-balance results, not actual intratrade equity observations.

U25/U65: no entry window and no range filter. F25: 07:05-08:55, range 0.00-0.60. F65: 07:30-08:55, range 0.00-0.60. All times broker clock. MIX: simulated shared account, F25 at 1% plus U25 at 0.3%.

Monthly returns 1 / 5

Return % (completed positions). MIX is a simulated combined account.

U25/U65: no entry window and no range filter. F25: 07:05-08:55, range 0.00-0.60. F65: 07:30-08:55, range 0.00-0.60. All times broker clock. MIX: simulated shared account, F25 at 1% plus U25 at 0.3%.

Combined account: 1% plus 0.3%

Requested allocation: filtered 0.25 at 1% and unfiltered 0.25 at 0.3%

Simulation result: \$10,000 becomes \$308,444.36, with \$298,444.36 net profit, 42.47% CAGR and 33.47% maximum closed-balance drawdown. The longest recovery is 510 calendar days. This adds return, but does not preserve F25's standalone drawdown level.

These are simulated balance curves, not a complete floating-equity curve. Daily and exit-event maximum balance DD agree in this run. Actual equity DD requires synchronised mark-to-market prices and can differ materially.

How the combination was simulated

One shared balance with risk budgets fixed at each actual entry

At each entry timestamp, allocate 1% of current closed balance to F25's risk budget and 0.3% to U25's budget. Scale each original trade by its normalized budget-R outcome. At its exit timestamp, credit the resulting P&L; to the common balance. Future entries then size from that updated balance.

Example: on a \$10,000 account, F25 budgets \$100 and U25 \$30. If their normalized outcomes are +2 R and -1 R, their P&L; is +\$200 and -\$30, subject to the entry balances used. This is not a 77/23 split of two separately compounded account curves.

Assumption	Implementation / limitation
Simultaneous events	Aggregate all exits at the timestamp, update balance, then size new entries. Simultaneous new entries share the same balance snapshot.
Overlapping positions	Keep both positions independent, including opposite directions. This requires compatible hedging/position-management behaviour; a netting account can change the trade paths.
Execution replay	Entry/exit times, direction and normalized outcome are held fixed. Fractional volume scaling is allowed; broker minimum/step/max volumes and margin rejection are not simulated.
Risk budget	1% plus 0.3% is increased exposure, not a hard cap on realized loss or instantaneous account risk. Each budget is based on its own entry balance.
Costs	Original normalized outcomes include recorded fills and zero commission/swap. No new spreads, slippage or per-lot charges are invented.
Verification	Replaying either standalone strategy alone at its original 1% reproduces its exported ending balance to less than one cent. All combined cash flows reconcile.

The counterfactual portfolio assumes both strategies can execute independently without changing each other's signals or fills. A native combined-EA real-tick test is required before treating these results as executable.

Combined-account metrics

Compare balance DD consistently; standalone floating equity is a separate statistic

Metric	U25 at 1%	F25 at 1%	MIX 1% + 0.3%
Net profit USD	222,001.55	117,166.84	298,444.36
Ending balance USD	232,001.55	127,166.84	308,444.36
CAGR %	38.35	30.02	42.47
Maximum balance DD %	33.05	27.16	33.47
CAGR / balance DD	1.160	1.105	1.269
Trade-level cash PF	1.312	1.407	1.404
Daily Sharpe	1.345	1.293	1.366
Daily Sortino	3.017	3.021	3.179
Annualized volatility %	25.75	21.34	27.81
Winning positions %	39.10	38.99	39.06
Completed positions	2,391	1,521	3,912
Mean winner USD	999.31	682.71	678.63
Mean loser USD	-489.59	-310.00	-309.90
Daily VaR 95% loss	1.003	1.000	1.299
Daily expected shortfall	1.019	1.014	1.316

MIX has trade-level PF 1.404 and daily-net PF 1.409. These differ because two positions may offset within a day. Worst day is -1.58%; best day +11.38%. No exact combined relative equity DD, equity-based Calmar or broker margin requirement can be recovered from closed-deal exports alone.

Do not compare MIX's balance DD directly to a standalone equity DD and call the difference an exact risk improvement. Use the common balance basis above, then confirm joint floating equity in the tester.

Where the mix helps, and where it hurts

Annual combined returns and strategy contributions

Year	U25 %	F25 %	MIX %	MIX net USD
2017	30.98	3.06	11.88	1,187.75
2018	60.56	23.02	40.99	4,585.71
2019	-13.20	-17.83	-21.61	-3,408.40
2020	40.73	23.19	36.06	4,458.30
2021	49.46	82.91	103.96	17,489.20
2022	58.83	49.84	70.62	24,231.82
2023	-16.68	10.75	4.12	2,413.54
2024	66.36	41.11	63.25	38,556.38
2025	63.66	60.04	84.31	83,898.95
2026	67.69	44.55	68.17	125,031.10

Adding U25 recovers some 2017-2018 opportunity: MIX returns 11.88% and 40.99%, versus F25's 3.06% and 23.02%. But both lose in 2019, and the combined loss deepens to -21.61%. In 2023, U25 detracts from F25's gain, reducing the combined return to +4.12%.

Within the simulated shared account, F25 contributes \$218,487.10 and U25 contributes \$79,957.25 of net P&L.; These contributions depend on the common compounding path and cannot be compared with standalone dollar profits as independent added value.

The combined account has 68 positive months out of 117 calendar rows and 248 positive weeks. Some initial rows contain no trades and uncertain data coverage. Its worst rolling 12-month return is -24.76%.

The full-horizon U25/F25 daily correlation is 0.783. Their differences help somewhat, but they remain related Gold breakout strategies. Added unfiltered exposure is not a hedge against every filtered drawdown.

Combined recovery and stress

The requested mix is more aggressive than the filtered strategy alone

Peak	Trough	Recovery	Days	Balance DD %
2019-03-26	2019-12-20	2020-08-17	510	33.47
2023-01-06	2023-09-13	2023-12-05	333	21.67
2023-12-11	2024-03-01	2024-05-10	151	20.06
2022-06-07	2022-08-03	2022-10-28	143	14.80
2020-08-19	2020-11-04	2021-01-08	142	16.49

MIX's longest recovery is 510 days versus F25's 654 days. Recovery is faster because the unfiltered component contributes opportunities after the trough, yet the initial combined decline is deeper: 33.47% versus 27.16% balance DD. Faster recovery and smaller drawdown are different objectives.

MIX stress metric	Value
20-day-block median balance DD	29.39%
95th-percentile balance DD	42.80%
99th-percentile balance DD	49.39%
5th-percentile CAGR	24.04%
Worst rolling 3 / 6 / 12 months	-19.06% / -21.43% / -24.76%

There are 1,512 entry events leaving both strategies open, including 19 with opposite directions. Same-direction overlap concentrates exposure; opposite positions are not automatically independent hedges because their stops and exit times differ.

Portfolio resampling uses 2,000 circular 20-weekday blocks, seed 20092026, sampling the combined daily return stream jointly. It does not independently shuffle the two strategies and falsely erase correlation. Cost changes, floating equity and new execution constraints are absent.

Separating added risk from diversification

Two comparison simulations keep the interpretation honest

Allocation	CAGR	Balance DD	Sharpe	Longest recovery
F25 1.0%	30.02%	27.16%	1.293	654 days
MIX: F25 1.0% + U25 0.3%	42.47%	33.47%	1.366	510 days
F25 1.3% only	39.45%	34.01%	1.293	661 days
Scaled MIX: F25 0.7692% + U25 0.2308%	32.20%	26.68%	1.366	504 days

Against F25 alone at 1.3%, the requested mix has better growth, slightly lower balance DD and a shorter recovery. This suggests some value from the additional trade pattern beyond simply increasing F25's risk. It does not make the mix low risk.

Scaling both weights down by 1.3 keeps their ratio while returning the nominal sum of entry-risk percentages to 1%. That simulation earns 32.20% CAGR with 26.68% balance DD and \$149,343 ending balance. Compared with F25 at 1%, the improvement is modest but more relevant to a drawdown-conscious objective.

The scaled mix is an illustrative diagnostic, not an optimized recommendation or a guaranteed 1% loss cap. Real volume rounding, entry-balance changes, slippage and correlated open risk require a proper portfolio replay. Selecting weights from this same history introduces additional selection bias.

Final assessment and next decision

Close the parameter search; resolve execution and sizing before live readiness

Conservative candidate: F65 remains reasonable for further validation. It sacrifices early opportunity but controls drawdown better than U65, with a slightly stronger full-period CAGR/equity-DD ratio. Its 503-day recovery remains a real cost. The unfiltered version remains the useful reference for growth and opportunity loss.

Aggressive candidate: revise the risk expectation. F25 is profitable over the full history but no longer supports a roughly 17% maximum-DD expectation at 1% risk. The longer history exposes 28.08% equity DD and a 654-day recovery. U25 grows faster but has 33.56% equity DD. Neither clearly fits a strict low-drawdown mandate at the tested sizing.

Requested combination: useful research, too aggressive to call a drawdown fix. The 1% + 0.3% mix restores some missed opportunity and improves recovery, but its 33.47% simulated balance DD is large. If combining is pursued, validate a reduced-risk allocation first; the scaled comparison is a starting hypothesis, not a newly optimized final setting.

Next, reproduce the proposed combination in a single correctly isolated strategy implementation or compatible hedging account, with unique position identifiers and explicit shared-account sizing. Test real ticks, commission/spread/slippage, lot limits, margin and simultaneous entries/exits. Export the joint floating-equity series so actual portfolio equity DD can be measured.

Investigate the January-March 2017 history gap and confirm V2/V3 equivalence for rules outside the two filters. If you want to isolate the time-window effect from the range-cap effect, one matched ablation with only one filter changed can answer that specific question; do not restart a broad optimization grid.

A system can be worth retaining through weak periods. The justification must be tolerable loss, recoverability, positive expectancy after costs and a useful portfolio role. F65 fits that argument more closely than F25 at its current sizing. Future observation after freezing the rules remains necessary.

Methods, sources and reproducibility

Definitions and boundaries of what the exports can establish

Standalone trades are paired from Orders and Deals. Net P&L; includes profit, commission and swap. Cash PF divides positive trade P&L; by absolute negative P&L.; Budget R divides net P&L; by 1% of pre-entry balance; it is not exact stop-distance R after lot rounding.

Balance DD uses each running closed-balance high; portfolio exits at identical timestamps are aggregated before measuring DD. Relative equity DD is transcribed only for standalone runs. Recovery runs from the last balance peak to first recovered balance, including weekends. Daily Sharpe/Sortino use zero benchmark and 252 weekdays; downside deviation includes zero days.

The missed-day attribution matches entry dates and separates omitted days from changed trades on retained days. Full omitted-trade counts include all outcomes. The example tables deliberately show both winners and losers. A late timestamp proves the original entry is outside the window, not that range eligibility or EA version is irrelevant.

Source workbooks: ORB_2017-2026_025(1).xlsx; 7-9_WITHRANGE_25ATR.xlsx; ORB_2017-2026_065(1).xlsx; 730-9_WITHRANGE_65ATR.xlsx. The previous 2020-only filtered exports are used only for overlap validation. All financial calculations are in USD.

This PDF also embeds CSV attachments with every omitted trade, all matched common-day comparisons, and the requested portfolio's trade/event/daily ledgers. Use the attachments panel in a desktop PDF reader to extract them. Browser previews may not expose embedded attachments. Example tables in the report are only a readable subset.

Primary method references: [MetaTrader 5 report-statistic definitions](#); [real and generated tick modelling](#); [Bailey et al., The Probability of Backtest Overfitting](#). These support definitions and selection-risk context, not the user-specific numerical outcomes.

The historical extension has already been viewed in this research process and is not pristine holdout data. No live fills, full equity ticks, native joint-account test or margin simulation were supplied. No unavailable equity statistic is replaced by an invented estimate.
